

Visualization for Data Science in R

Angela Zoss

Data Matters 2021

<https://www.angelazoss.com/RVis-2Day/>

Try right now:
Open RStudio
Try running “library(tidyverse)”
Tell me about any errors

Objectives/Outline

Day 1: Basic visualizations

- Visualization and data science
- Basic ggplot2 syntax
- Basics of geoms and aes
- Categorical variables
- Manipulating data
- Customizing plots
- Advanced topics: mapping, saving charts out

Day 2: Websites and Shiny apps

- Simple interactive plots
- Arranging charts into dashboards
- Incorporating Shiny elements into documents, dashboards
- Advanced topics: full Shiny apps

Set up environment

- R
- RStudio
- packages

Packages:

- tidyverse
- knitr
- shiny
- plotly
- DT
- crosstalk
- flexdashboard
- maps
- mapproj
- sf

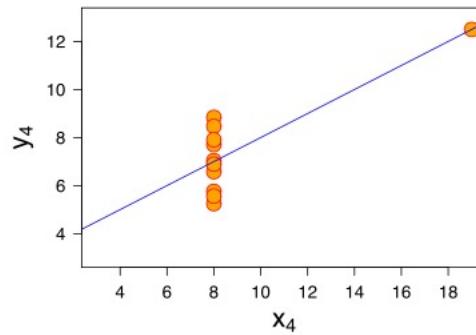

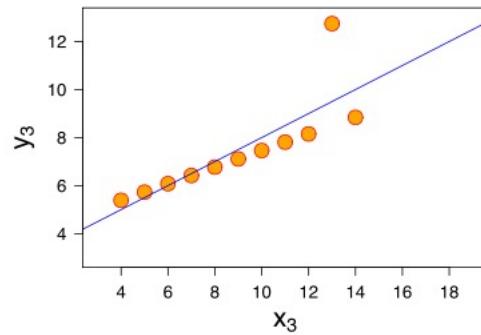

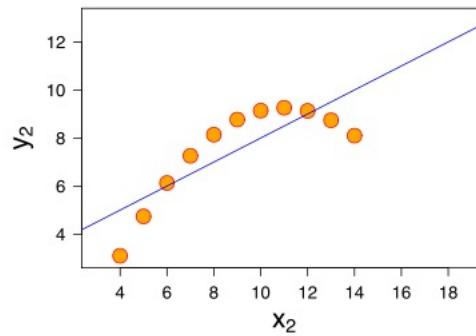

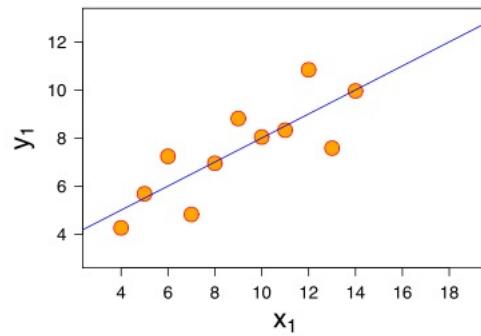

What does it mean to represent data visually?
Why do it?

Math is hard

1		2		3		4	
x	y	x	y	x	y	x	y
10.0	8.04	10.0	9.14	10.0	7.46	8.0	6.58
8.0	6.95	8.0	8.14	8.0	6.77	8.0	5.76
13.0	7.58	13.0	8.74	13.0	12.74	8.0	7.71
9.0	8.81	9.0	8.77	9.0	7.11	8.0	8.84
11.0	8.33	11.0	9.26	11.0	7.81	8.0	8.47
14.0	9.96	14.0	8.10	14.0	8.84	8.0	7.04
6.0	7.24	6.0	6.13	6.0	6.08	8.0	5.25
4.0	4.26	4.0	3.10	4.0	5.39	19.0	12.50
12.0	10.84	12.0	9.13	12.0	8.15	8.0	5.56
7.0	4.82	7.0	7.26	7.0	6.42	8.0	7.91
5.0	5.68	5.0	4.74	5.0	5.73	8.0	6.89

Almost identical summary statistics:
x & y mean
x & y variance
x-y correlation
x-y linear regression

Shapes are much easier

Anscombe's Quartet

http://en.wikipedia.org/wiki/Anscombe%27s_quartet

Why visualize in R?

- Quickly explore data
- Save time switching to another tool
- Use charts to inspire new analyses and vice versa
- Reproducibility

Why care about reproducibility?

- Open science makes review easier
- Increasingly a requirement
- Saves you a lot of time trying to figure out what you did last time!

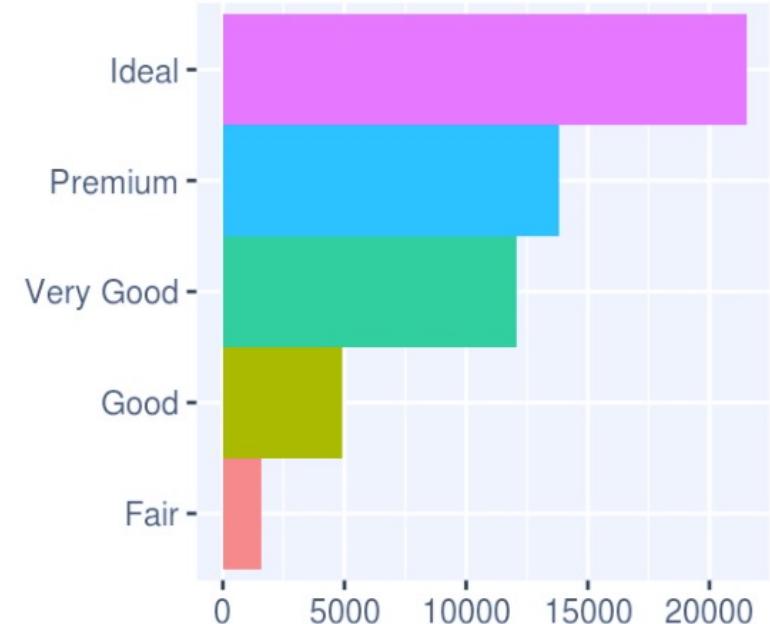

*“Your closest collaborator is **you** six months ago,
but you don’t reply to emails.”*

- *Mark Holder*

ggplot2

What is ggplot2?

an R package designed to create plots based on a theory of the grammar of graphics.

Grammar of graphics

1. DATA: a set of data operations that create variables from datasets
2. TRANS: variable transformations (e.g., rank)
3. SCALE: scale transformations (e.g., log)
4. COORD: a coordinate system (e.g., polar)
5. ELEMENT: graphs (e.g., points) and their aesthetic attributes (e.g., color)
6. GUIDE: one or more guides (axes, legends, etc.).

Wilkinson, Leland. (2005). *The grammar of graphics (2nd ed)*. New York: Springer.

Why ggplot2 instead of base R?

- nice defaults
- easy faceting
- (arguably) more natural syntax
- can switch chart types more easily

“Why I use ggplot2”, David Robinson

<http://varianceexplained.org/r/why-i-use-ggplot2/>

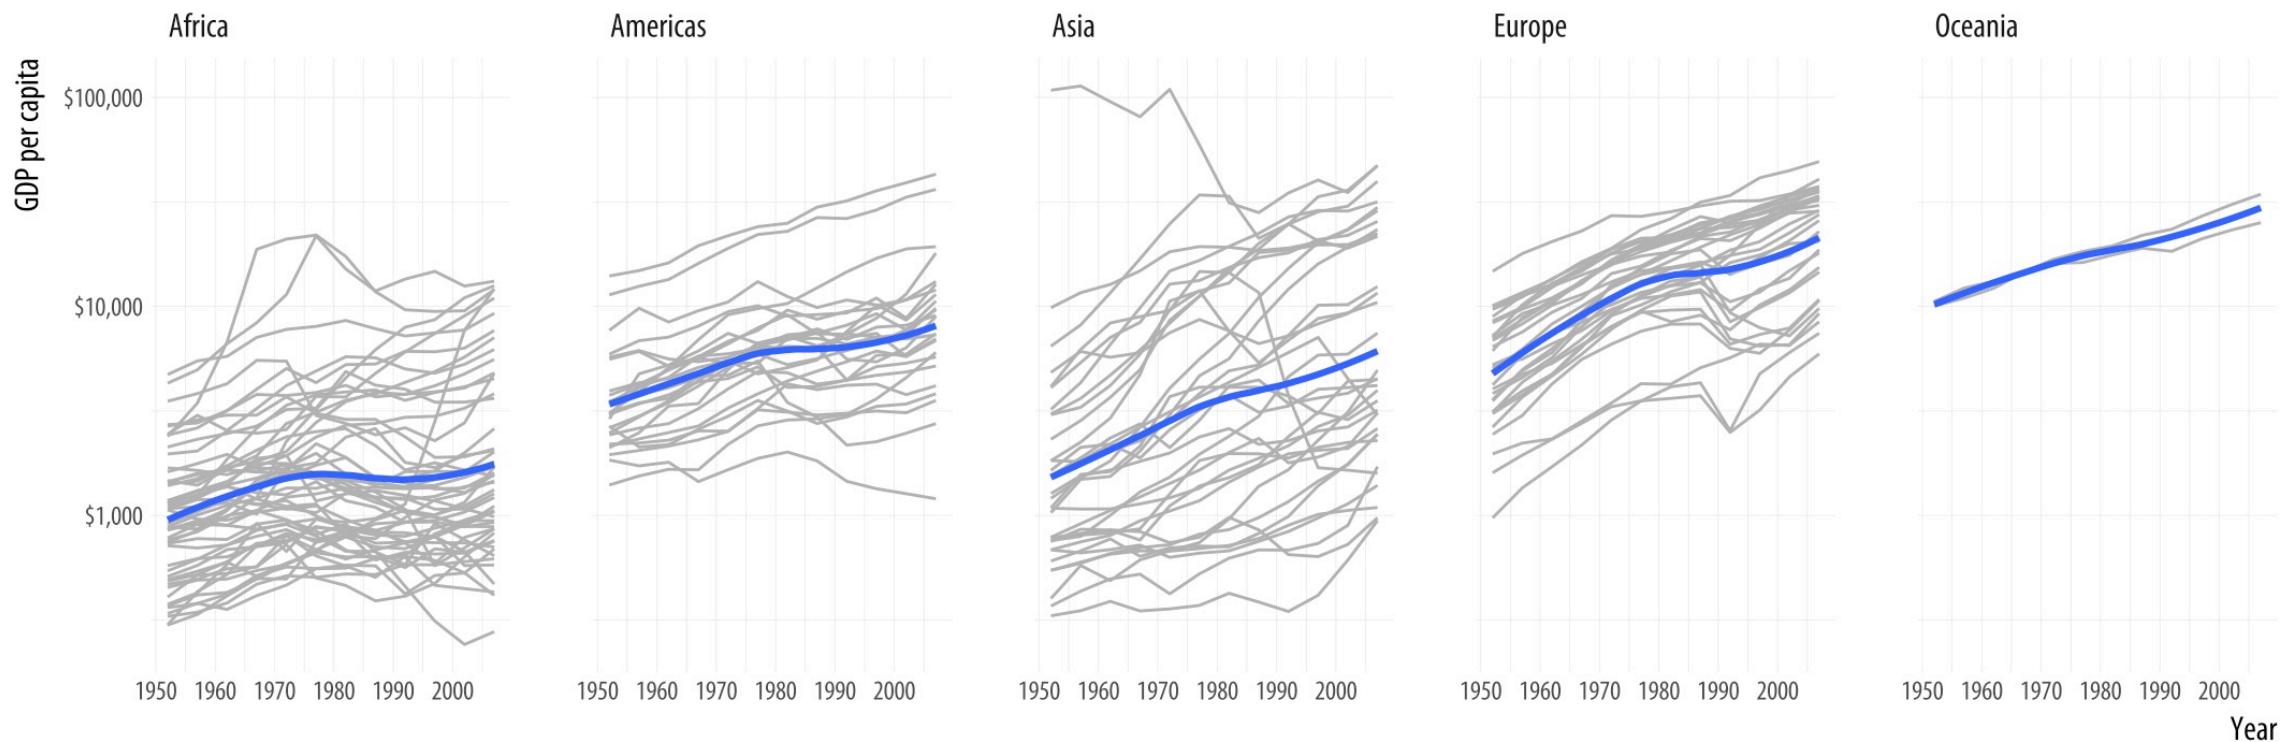

R vs. Excel, Tableau, etc.

Questions to ask:

- Are you already using R? Why switch?
- Are you going to have to share this process or reproduce it? Try R!
- Is it a quick project, or will others work on it? Maybe Excel is fine.
- Do you need to try a bunch of charts quickly, build interactive components, etc.? Tableau might be more powerful and faster.

ggplot2 examples

Working in RStudio

Get workshop files

URL: <https://github.com/amzoss/RVis-2Day>

On GitHub:

- Click green “Code” button and select “Download ZIP”
- Unzip files on your laptop
 - Windows: Double-click, then look for “Extract Files” at the top
 - Mac: Double-click

In RStudio:

- Project → New project...
- Existing directory
- Select unzipped folder
- Create Project

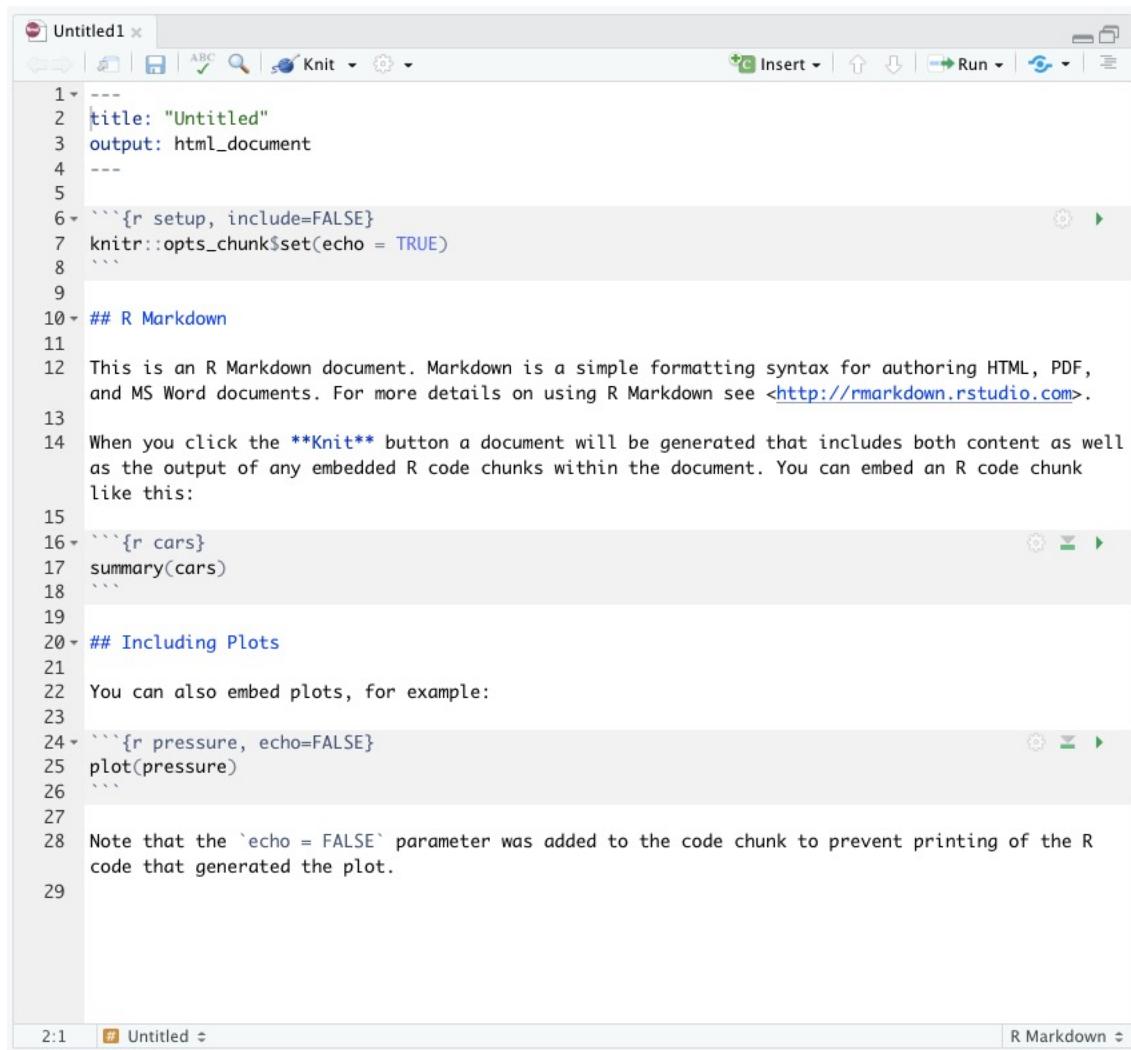

Why R Markdown?

- Plots show up inline
- Easier to incorporate explanatory text and materials
- Like to be able to easily run one chunk at a time

Caution: Running things out of order can mean your code won't work again later. Clear your environment often and run code chunks in order to be safe.

R Markdown files

- First few lines are called YAML header, set up some properties of file
- R code goes inside code chunks
- Text in Markdown syntax goes in between code chunks
- Use the “play” button to run individual code chunks
- Knit or run all to run the entire document

```
Untitled1 x
ABC Knit ▾
Insert ▾ Run ▾

1 ---  
2 title: "Untitled"  
3 output: html_document  
4 ---  
5  
6 ```{r setup, include=FALSE}  
7 knitr::opts_chunk$set(echo = TRUE)  
8 ````  
9  
10 ## R Markdown  
11  
12 This is an R Markdown document. Markdown is a simple formatting syntax for authoring HTML, PDF,  
and MS Word documents. For more details on using R Markdown see <http://rmarkdown.rstudio.com>.  
13  
14 When you click the **Knit** button a document will be generated that includes both content as well  
as the output of any embedded R code chunks within the document. You can embed an R code chunk  
like this:  
15  
16 ```{r cars}  
17 summary(cars)  
18 ````  
19  
20 ## Including Plots  
21  
22 You can also embed plots, for example:  
23  
24 ```{r pressure, echo=FALSE}  
25 plot(pressure)  
26 ````  
27  
28 Note that the `echo = FALSE` parameter was added to the code chunk to prevent printing of the R  
code that generated the plot.  
29
```

R Markdown test

- File → New File → R Markdown
- Click OK to accept defaults
- Type inside the first few lines to edit the YAML header (edit title, add author, etc.)
- Add a new R code chunk at the end of the file using Insert → R
- Type some R code inside the code chunk:
library(tidyverse)
- Run the new code chunk

A screenshot of the RStudio interface showing an R code editor. The code in the editor is:

```
29
30  ````{r}
31
32  library(tidyverse)|
33
34  ...
35
```

The code editor has a toolbar with icons for gear, dropdown, and run.

ggplot2 Cheat Sheet

Data Visualization with ggplot2

Data Visualization with ggplot2 :: CHEAT SHEET

Basics

ggplot2 is based on the **grammar of graphics**, the idea that you can build every graph from the same components: a **data set**, a **coordinate system**, and **geoms**—visual marks that represent data points.

To display values, map variables in the data to visual properties of the geom (**aesthetics**) like **size**, **color**, and **x** and **y** locations.

Complete the template below to build a graph.

```
ggplot(data = <DATA>) +  
  <GEOM_FUNCTION>(<mapping = aes(<MAPPINGS>)>,  
  stat = <STAT>, position = <POSITION>) +  
  <COORDINATE_FUNCTION> +  
  <FACET_FUNCTIONS> +  
  <SCALE_FUNCTIONS> +  
  <THEME_FUNCTIONS>
```

ggplot(data = mpg, aes(x = cyl, y = hwy)) Begins a plot that you finish by adding layers to. Add one geom function per layer.

geom_point() +
 geom_line() +
 geom_bar() +
 ...

Creates a complete plot with given data, geom, and mappings. Supplies many useful defaults.

last_plot() Returns the last plot

ggsave("plot.png", width = 5, height = 5) Saves last plot as 5'x5' file named "plot.png" in working directory. Matches file type to file extension.

Geoms

Use a geom function to represent data points, use the geom's aesthetic properties to represent variables. Each function returns a layer.

GRAPHICAL PRIMITIVES

a <- ggplot(economics, aes(date, unemployed))
b <- ggplot(seals, aes(x = long, y = lat))

a + geom_point()
(Useful for expanding limits)

b + geom_curve(aes(yend = lat + 1, xend = long, curvature = -1), x, y, yend, alpha, angle, color, curvature, linetype, size, linemetre=1)

a + geom_path(linend = "butt", linejoin = "round", x, y, alpha, color, group, linetype, size)

a + geom_rect(aes(xmin = 1, ymin = 1, xmax = 10, ymax = 10), x, y, alpha, color, fill, group, linetype, size)

b + geom_rect(aes(xmin = 1, ymin = 1, xmax = 10, ymax = 10), x, y, alpha, color, fill, group, linetype, size)

a + geom_ribbon(aes(ymin = unemployed - 900, ymax = unemployed + 900), x, y, alpha, color, fill, group, linetype, size)

a + geom_smooth(method = lm, x, y, alpha, color, fill, group, linetype, size, weight)

a + geom_text(aes(label = cyl), nudge_x = 1, nudge_y = 1, check_overlap = TRUE), x, y, label, alpha, angle, color, family, fontface, hjust, linheight, size, vjust

TWO VARIABLES

continuous x, continuous y

c <- ggplot(mpg, aes(cty, hwy))

c + geom_label(aes(label = cyl), nudge_x = 1, nudge_y = 1, check_overlap = TRUE), x, y, label, alpha, angle, color, family, fontface, hjust, linheight, size, vjust

c + geom_liner(hight = 2, width = 2), x, y, alpha, color, fill, shape, size, stroke

c + geom_point(), x, y, alpha, color, fill, shape, size, stroke

c + geom_quantile(), x, y, alpha, color, group, linetype, size, weight

c + geom_rug(sides = "bl"), x, y, alpha, color, fill, group, linetype, size, weight

c + geom_smooth(method = lm), x, y, alpha, color, fill, group, linetype, size, weight

c + geom_text(aes(label = cyl), nudge_x = 1, nudge_y = 1, check_overlap = TRUE), x, y, label, alpha, angle, color, family, fontface, hjust, linheight, size, vjust

continuous bivariate distribution

h <- ggplot(diamonds, aes(carat, price))

h + geom_bin2d(binwidth = c(0.25, 500)), x, y, alpha, color, fill, linetype, size, weight

h + geom_density2d(), x, y, alpha, colour, group, linetype, size

h + geom_hex(), x, y, alpha, colour, fill, size

continuous function

i <- ggplot(economics, aes(date, unemployed))

i + geom_area(), x, y, alpha, color, fill, linetype, size

i + geom_line(), x, y, alpha, color, group, linetype, size

i + geom_step(direction = "hv"), x, y, alpha, color, group, linetype, size

visualizing error

j <- data.frame(grp = c("A", "B"), fit = 4.5, se = 1:2)

j + geom_crossbar(fatten = 2), x, y, ymin, ymax, alpha, color, fill, group, linetype, size

j + geom_errorbar(), x, y, ymin, ymax, alpha, color, group, linetype, size, width (also geom_errorbarh())

j + geom_linerange(), x, ymin, ymax, alpha, color, group, linetype, size

j + geom_pointrange(), x, ymin, ymax, alpha, color, fill, group, linetype, size

maps

data <- data.frame(murder = USArrests\$Murder, state = tolowerrownames(USArrests))

state <- distinct(state)

k <- ggplot(data, aes(fill = murder))

k + geom_map(aes(map_id = state), map = map) + expand_limits(x = mapLong, y = mapLat), map_id, alpha, color, fill, linetype, size

THREE VARIABLES

seals\$z <- with(seals, sqrt(data.long^2 + delta_lat^2))

l <- ggplot(seals, aes(long, lat))

l + geom_contour(aes(z = z)), x, y, z, alpha, colour, group, linetype, size, weight

l + geom_tile(aes(fill = z)), x, y, alpha, color, fill, linetype, size, width

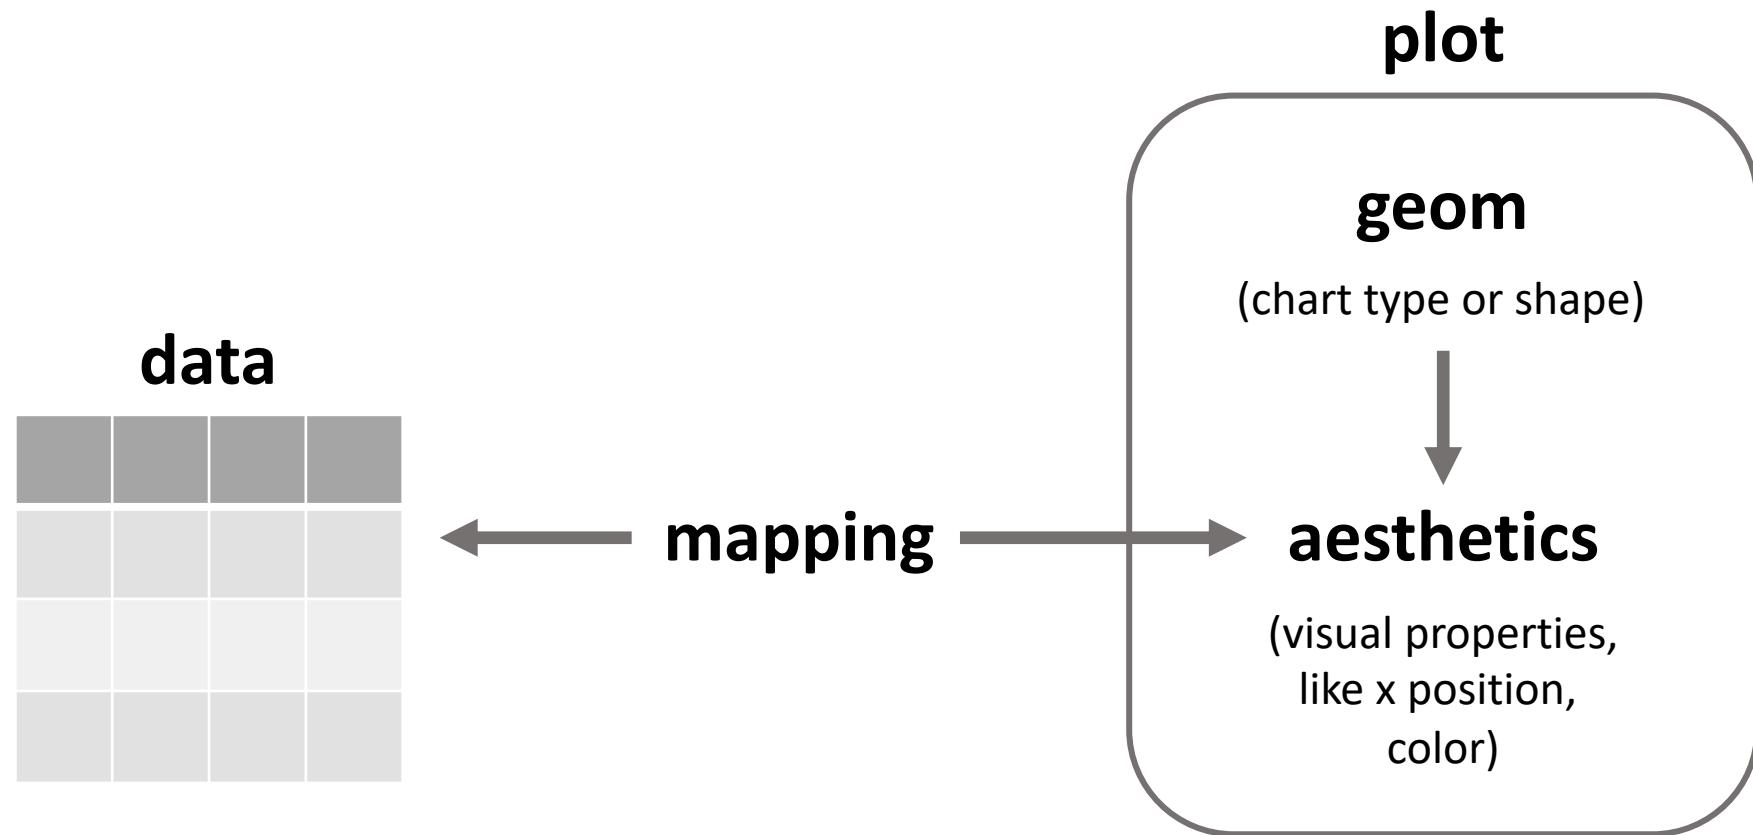

RStudio® is a trademark of RStudio, Inc. • CC BY SA RStudio • info@rstudio.com • 844-448-1212 • rstudio.com • Learn more at <http://ggplot2.tidyverse.org> • ggplot2 2.1.0 • Updated: 2016-11

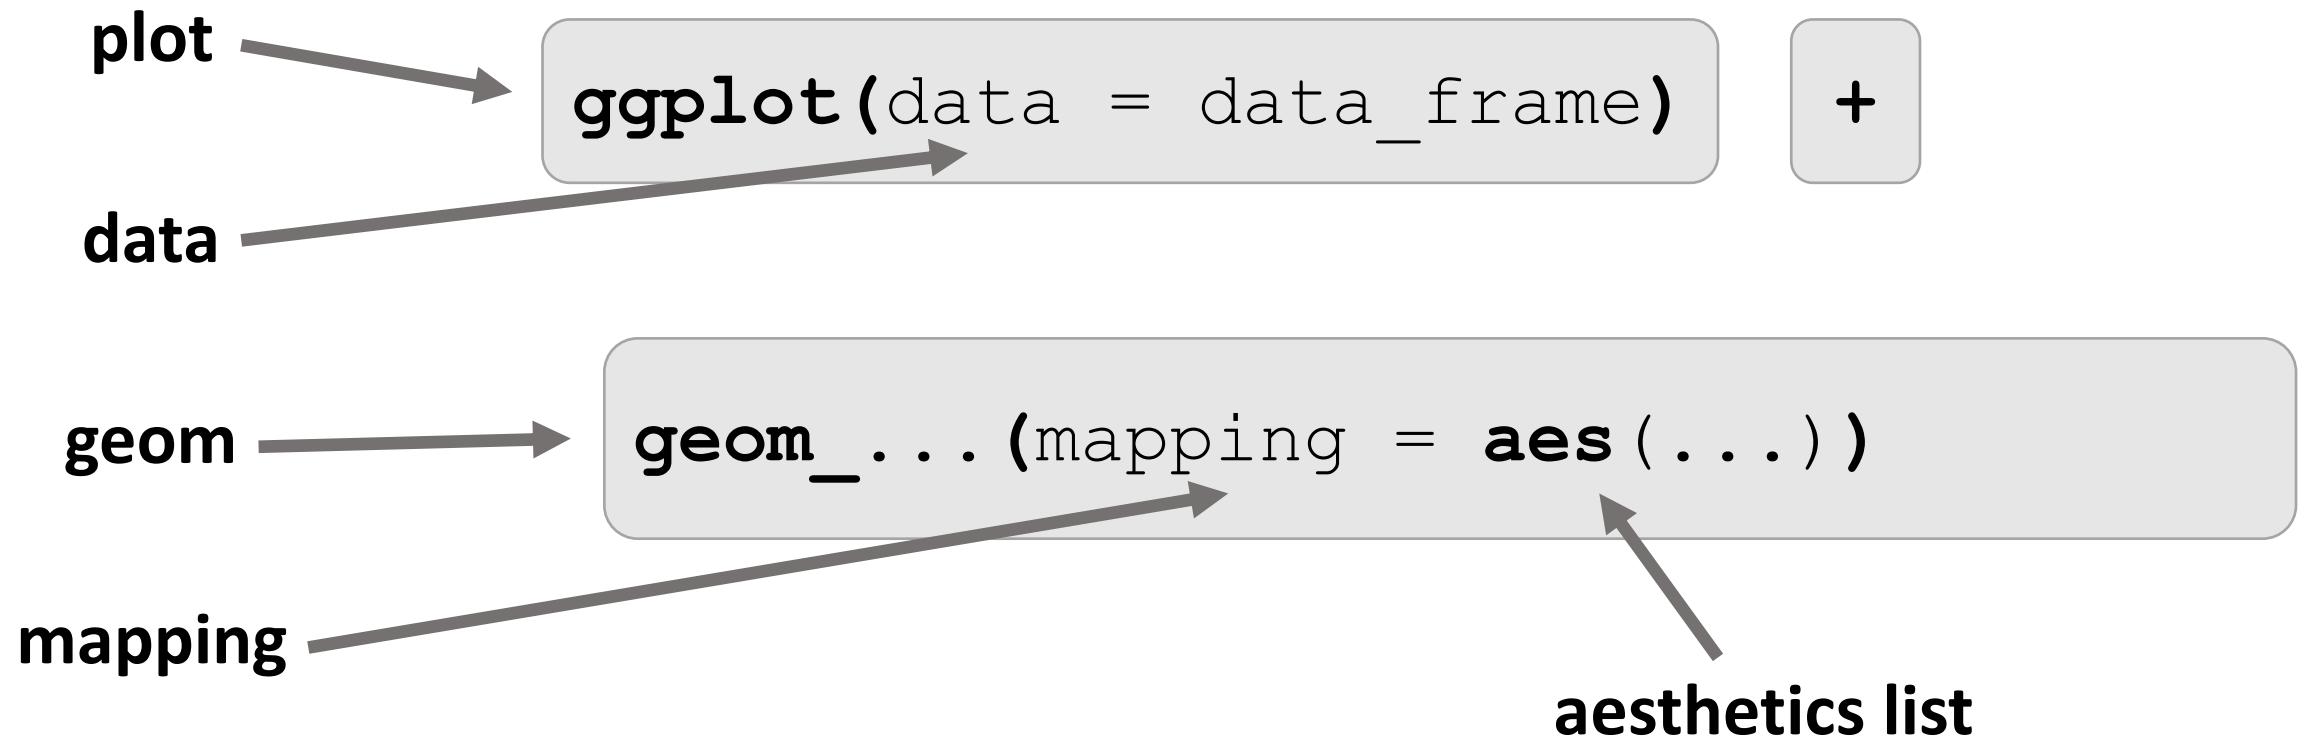

<https://www.rstudio.com/resources/cheatsheets/#ggplot2>

ggplot2: making a basic plot

Basic elements in any ggplot2 visualization

Template for a simple plot

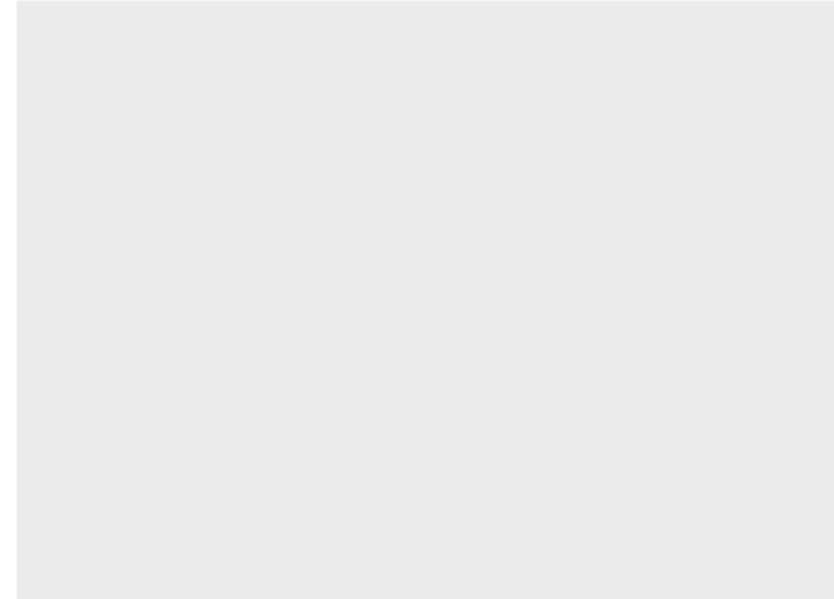

1. Set the data

"iris"

	Petal.Width	Petal.Length	Species
	0.3	1.4	setosa
	1.3	4.0	versicolor
	2.1	5.7	virginica

```
ggplot(data=iris)
```

2. Choose a shape layer

"iris"

	Petal.Width	Petal.Length	Species
	0.3	1.4	setosa
	1.3	4.0	versicolor
	2.1	5.7	virginica

```
ggplot(data=iris) +  
  geom_point()
```

Error: geom_point requires
the following missing
aesthetics: x and y

Types of geoms

- geom_bar()
- geom_point()
- geom_histogram()
- geom_map()
- etc.

<http://bit.ly/ggplot2-cheatsheet>

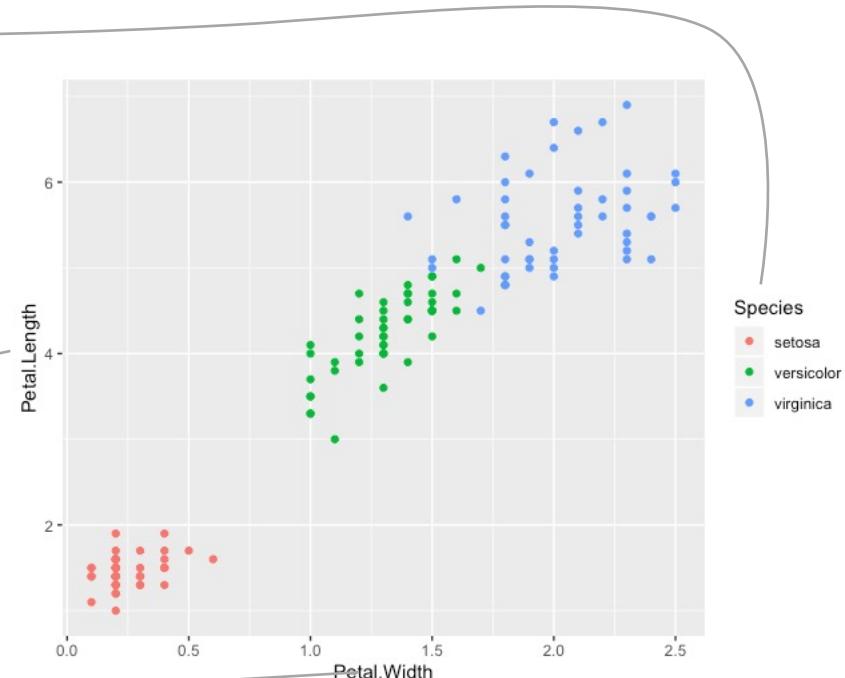

3. Map variables to aesthetics

“iris”

Petal.Width	Petal.Length	Species
0.3	1.4	setosa
1.3	4.0	versicolor
2.1	5.7	virginica

x position y position color

```
ggplot(data=iris) +  
  geom_point(  
    mapping=aes(x=Petal.Width,  
                y=Petal.Length,  
                color=Species))
```

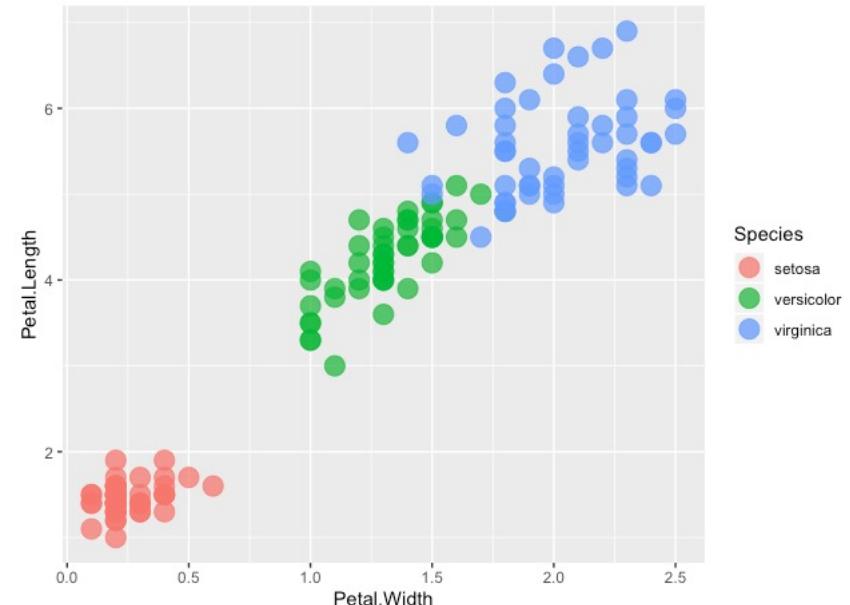

4. Add non-variable adjustments

"iris"

	Petal.Width	Petal.Length	Species
	0.3	1.4	setosa
	1.3	4.0	versicolor
	2.1	5.7	virginica

```
ggplot(data=iris) +  
  geom_point(  
    mapping=aes(x=Petal.Width,  
                y=Petal.Length,  
                color=Species),  
    size=5, alpha=.75)
```

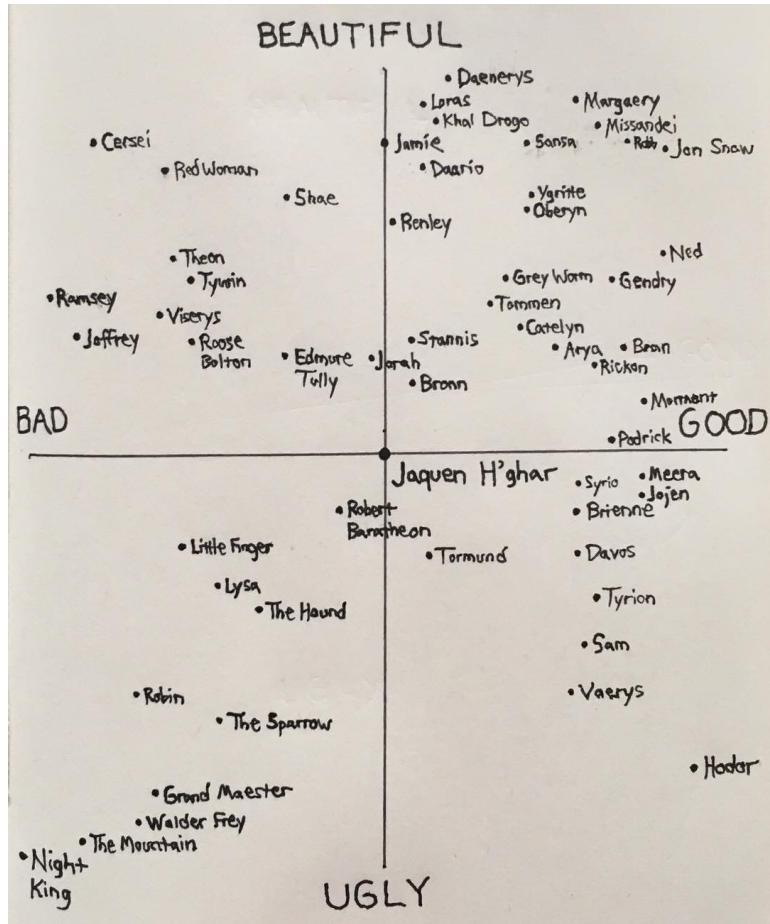

Debugging code

- Start simple
 - If you see an error:
 - read error message for hints
 - check for problems with spelling/punctuation marks
 - Get code to run without errors
 - Check result to see if it makes sense
- 
- Add a small change
 - Get code to run without errors
 - Check result to see if it makes sense
 - etc.

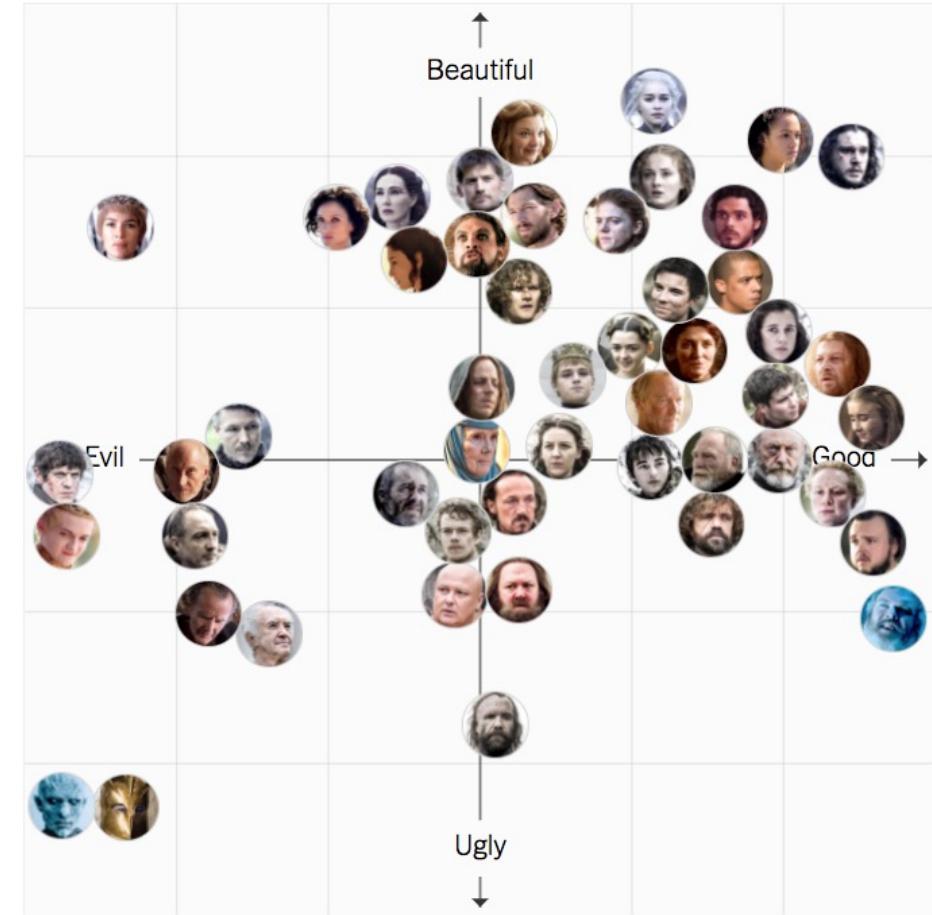

Exercise 1: Game of Thrones character ratings

[https://www.nytimes.com/interactive/2017/08/09/upshot/game-of-thrones-
chart.html](https://www.nytimes.com/interactive/2017/08/09/upshot/game-of-thrones-chart.html)

Game of Thrones character ratings

<https://www.instagram.com/p/BWnn-YogX1n/>

<https://www.nytimes.com/interactive/2017/08/09/upshot/game-of-thrones-chart.html>

ggplot2: inheritance

Template for a simple plot

**main plot
function**

```
ggplot(data = data_frame)
```

+

**shape
layer**

```
geom_... (mapping = aes(...),  
non-variable adjustments)
```

Expanded template

**main plot
function**

```
ggplot(data = data_frame,  
       mapping = aes(...))
```

+

**shape
layer**

```
geom_... (data = data_frame,  
          mapping = aes(...),  
          non-variable adjustments)
```

Inheritance

data and aesthetics will carry through from main function to shape layers

**main plot
function**

```
ggplot(data = data_frame,  
       mapping = aes(...))
```

+

**shape
layer**

```
geom_... (data = data_frame,  
         mapping = aes(...),  
         non-variable adjustments)
```

+

**shape
layer**

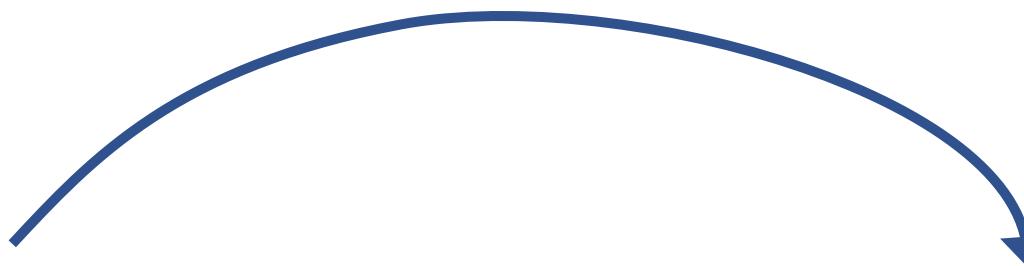

```
geom_... (data = data_frame,  
         mapping = aes(...),  
         non-variable adjustments)
```

+

Data aggregation

About %>%

- Loads automatically with tidyverse
- Used throughout tidyverse (except for ggplot2)
- Pushes data from the left into the function on the right

data_frame %>% function(args)

A blue curved arrow originates from the left side of the word "data_frame" and points to the right side of the word "function".

drop_na

Remove rows with NA values, either in any column or in specified columns

```
data %>% drop_na()
```

```
data %>% drop_na(age)
```

<https://www.rstudio.com/resources/cheatsheets/> (Data Import with Tidyr Cheatsheet)

count

Take a dataset, group it by one or more variables, and count the number of rows grouped. Count will be stored in a variable called “n”.

```
data %>% count(sex)
```

sex	n
m	23
f	45

```
data %>% count(sex, marital_status)
```

sex	marital_status	n
m	married	18
m	unmarried	5
f	married	31
f	unmarried	14

Exercise 2: Git Experience data

<https://osf.io/57tb8/>

Working with text variables

Text variables

In R, “character” variables

Gender	Age	Household Income	Education
Response	Response	Response	Response
Male	18-29		High school degree
Male	18-29	\$0 - \$24,999	Bachelor degree
Male	18-29	\$0 - \$24,999	High school degree
Male	18-29	\$100,000 - \$149,999	Some college or Associate degree
Male	18-29	\$100,000 - \$149,999	Some college or Associate degree
Male	18-29	\$25,000 - \$49,999	Bachelor degree
Male	18-29		High school degree
Male	18-29		High school degree
Male	18-29	\$0 - \$24,999	Some college or Associate degree
Male	18-29	\$25,000 - \$49,999	Some college or Associate degree
Male	18-29	\$25,000 - \$49,999	Bachelor degree
Male	30-44	\$50,000 - \$99,999	Graduate degree
Male	18-29		High school degree
Male	18-29	\$0 - \$24,999	Some college or Associate degree
Male	18-29	\$50,000 - \$99,999	Bachelor degree

Problems with text variables:
Ordering

Factors

- Default ordering for categories: **alphabetical**
- Converting to factor allows you to:
 - Specify “levels” for a categorical variable
 - Specify the order of those levels
 - Specify whether the factor is “ordered”

<https://r4ds.had.co.nz/factors.html>

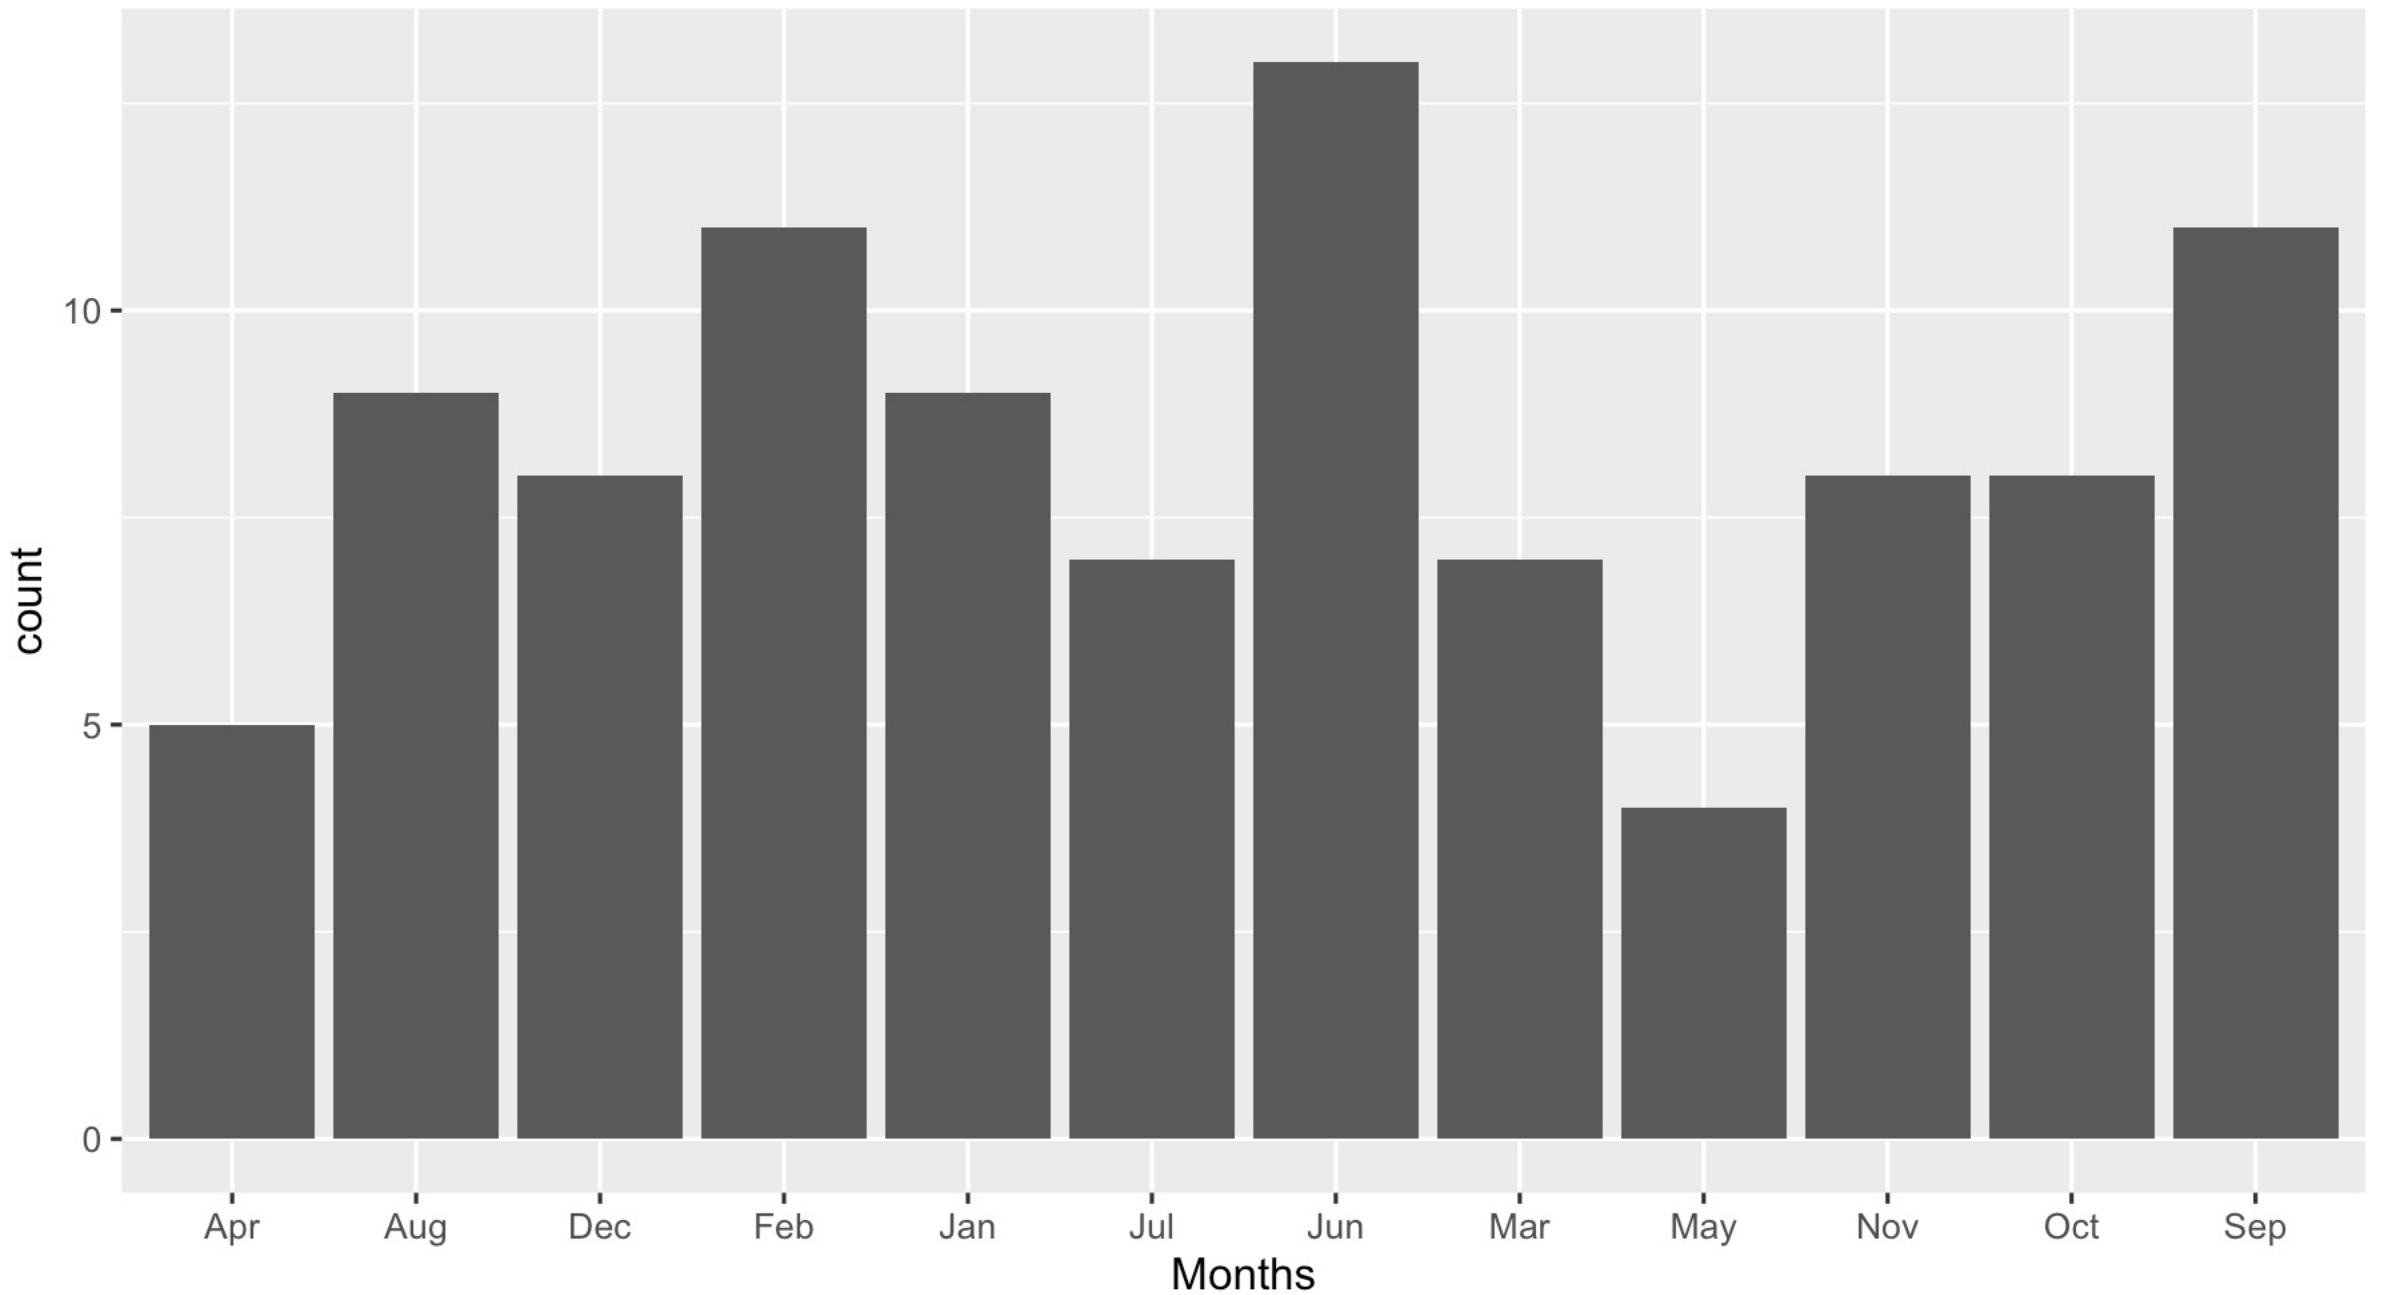

```
> x1 <- c("Dec", "Apr", "Jan",  
"Mar")
```

```
> factor(x1)  
[1] Dec Apr Jan Mar  
Levels: Apr Dec Jan Mar
```

```
> month_levels <- c( "Jan", "Feb",  
"Mar", "Apr", "May", "Jun", "Jul",  
"Aug", "Sep", "Oct", "Nov", "Dec" )
```

```
> y1 <- factor(x1,  
                levels = month_levels)  
> y1  
[1] Dec Apr Jan Mar
```

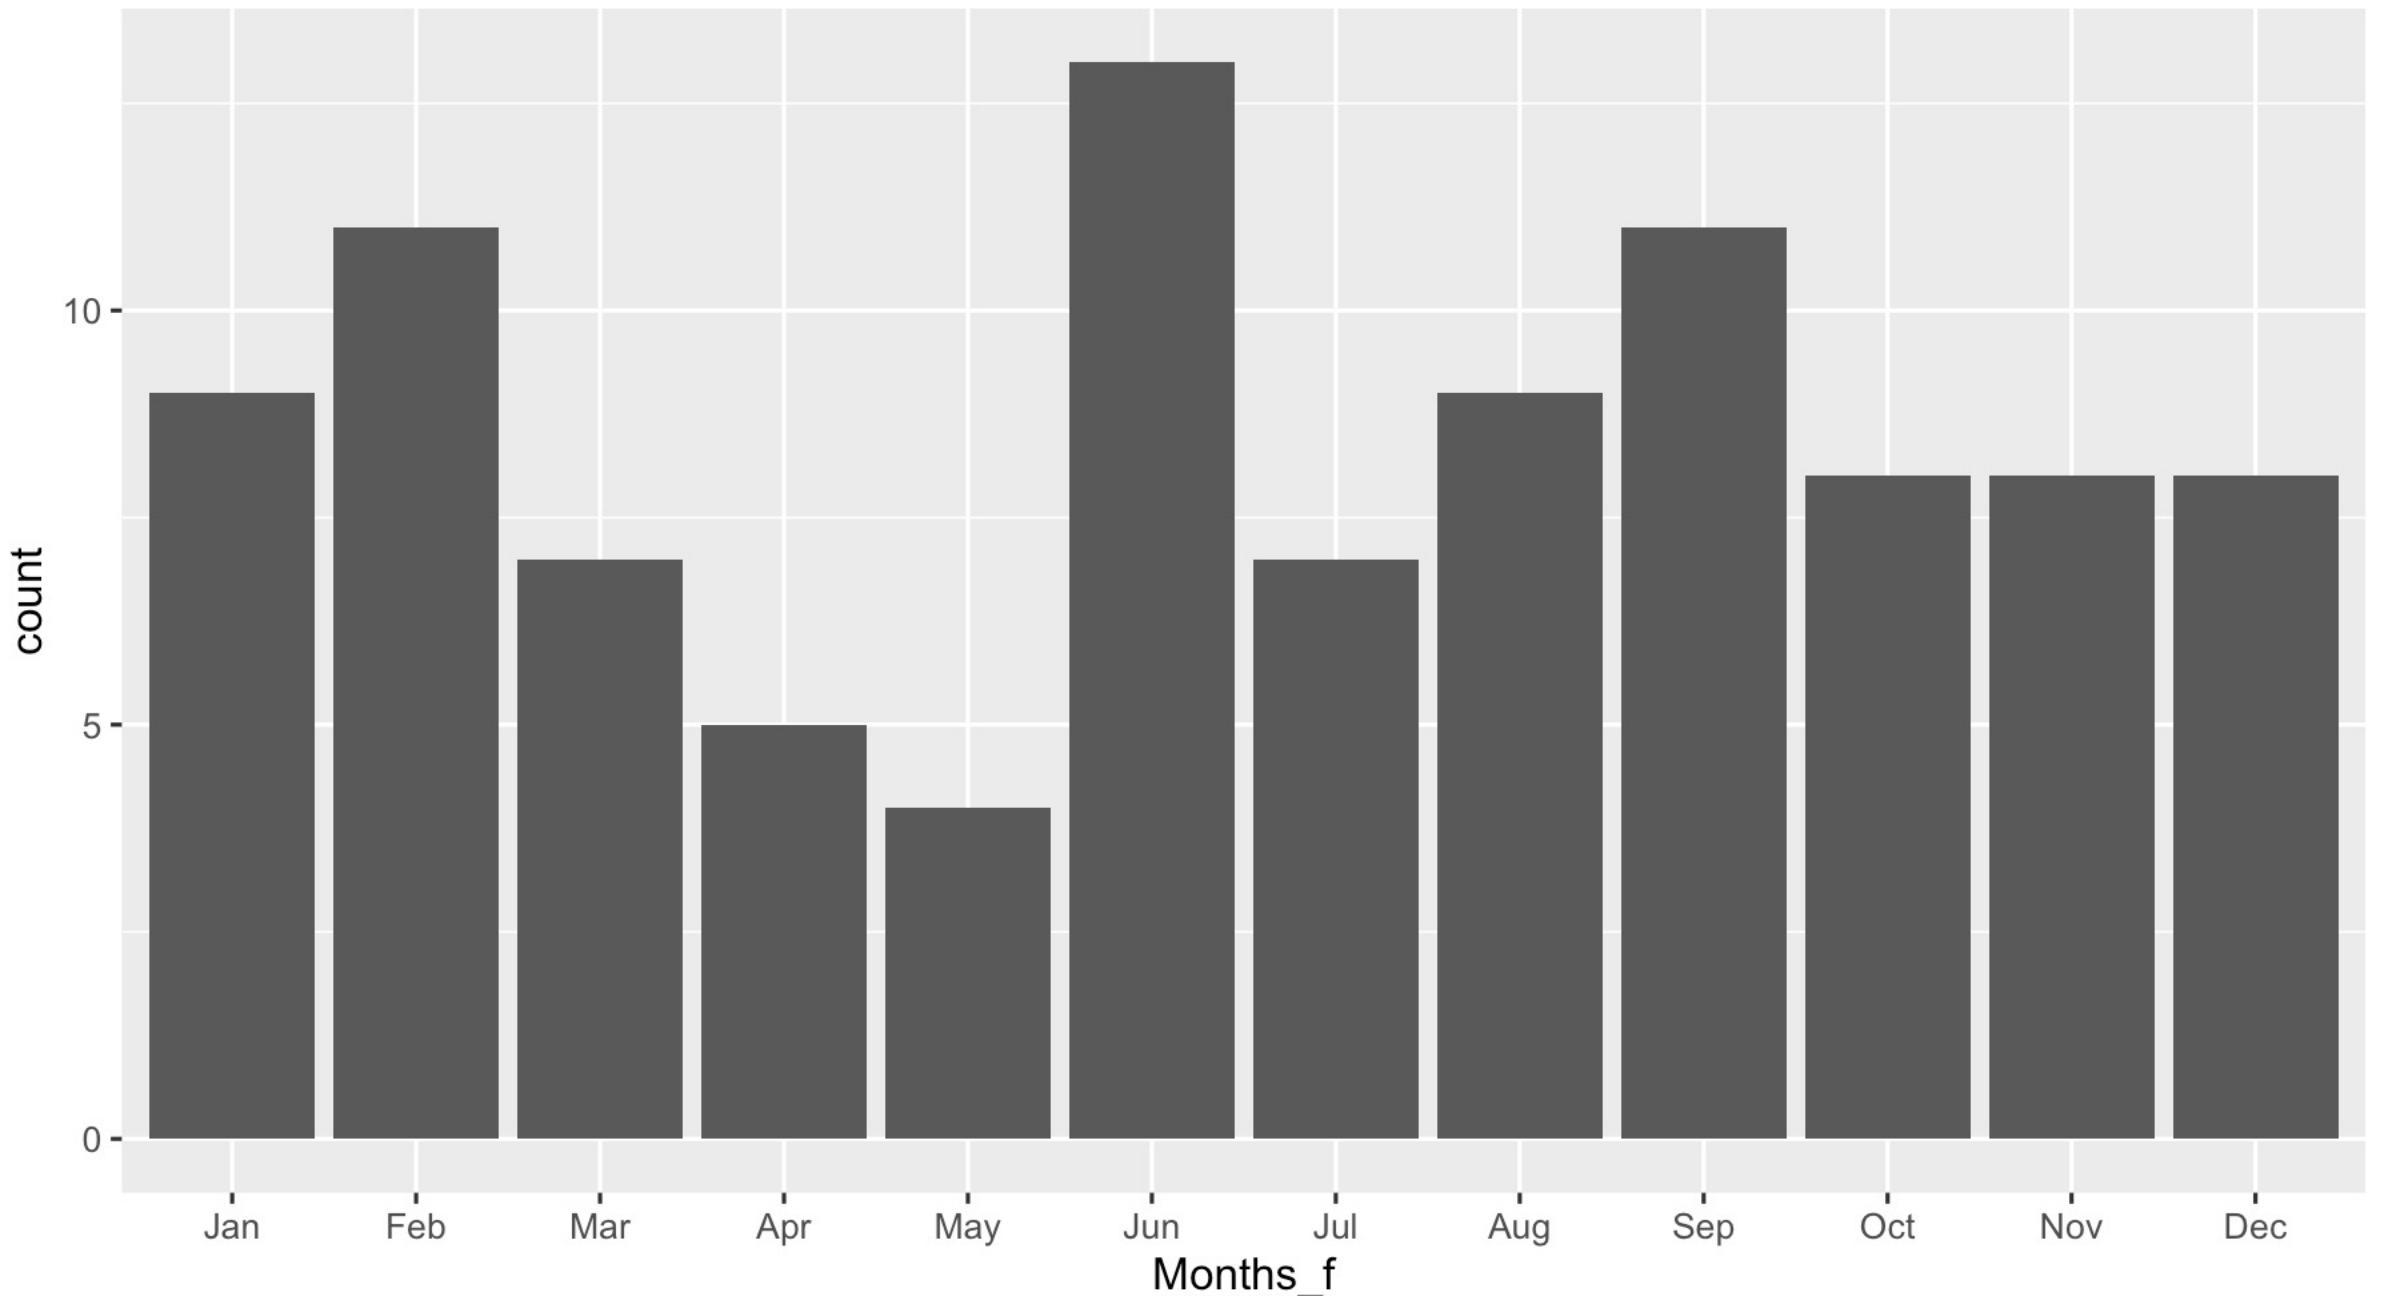

```
Levels: Jan Feb Mar Apr May Jun Jul  
Aug Sep Oct Nov Dec
```

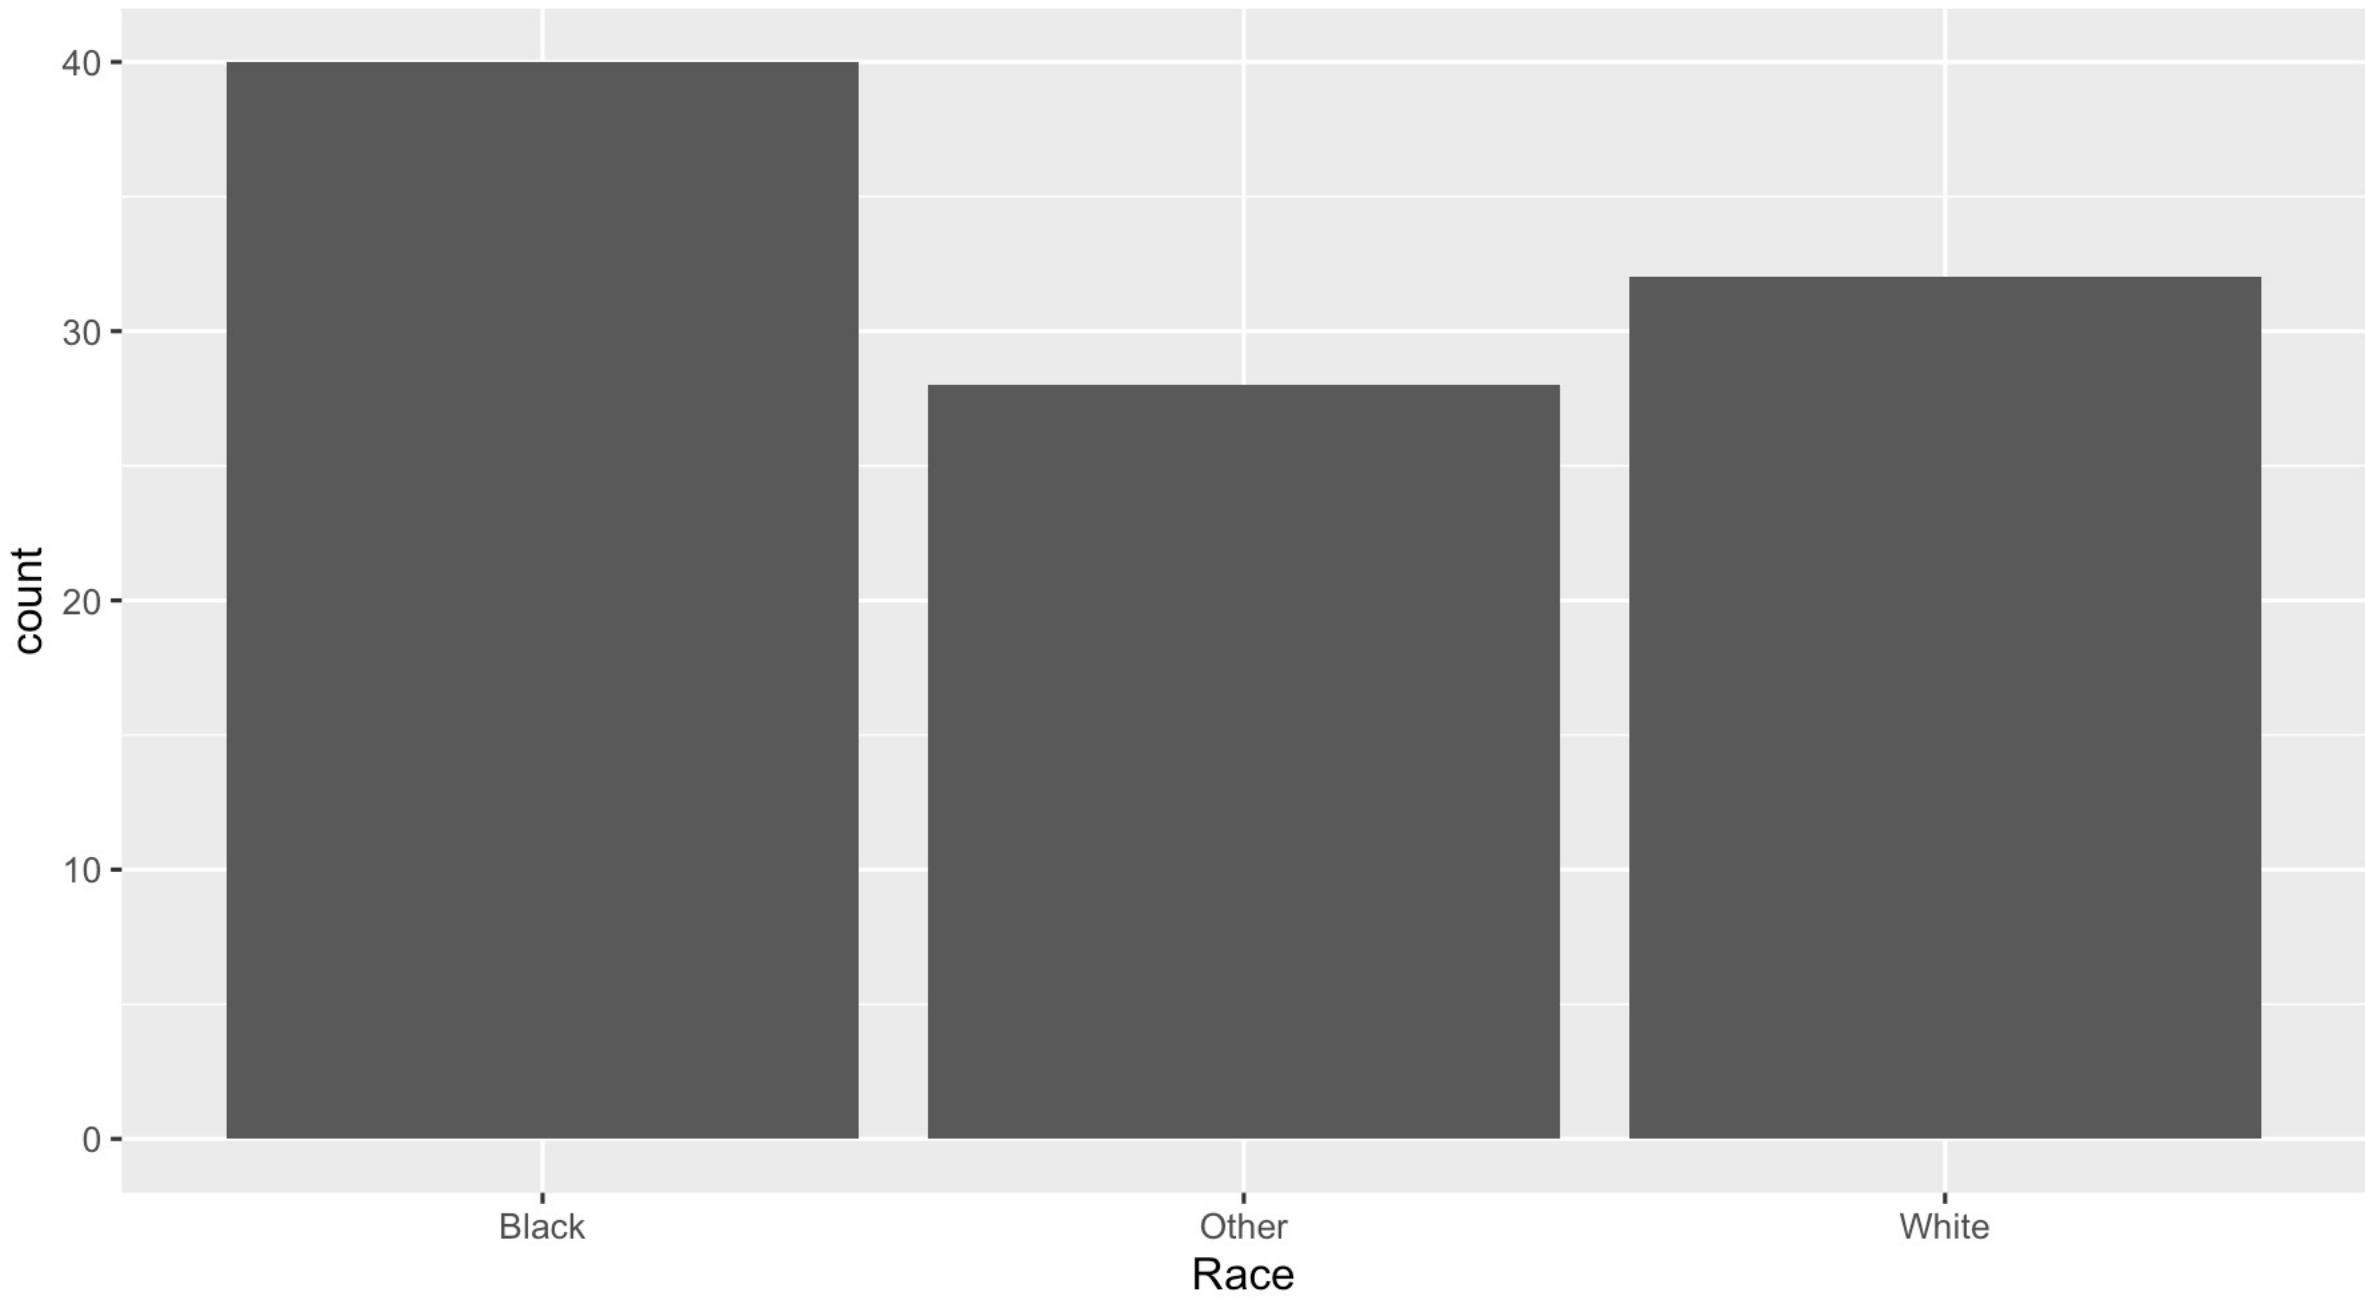

Order by meaning

```
month_levels <- c( "Jan", "Feb", "Mar", "Apr",
"May", "Jun", "Jul", "Aug", "Sep", "Oct", "Nov",
"Dec" )

data <- data %>%
  mutate(Months_f = Months %>%
    as_factor() %>%
    fct_relevel(month_levels) )
```

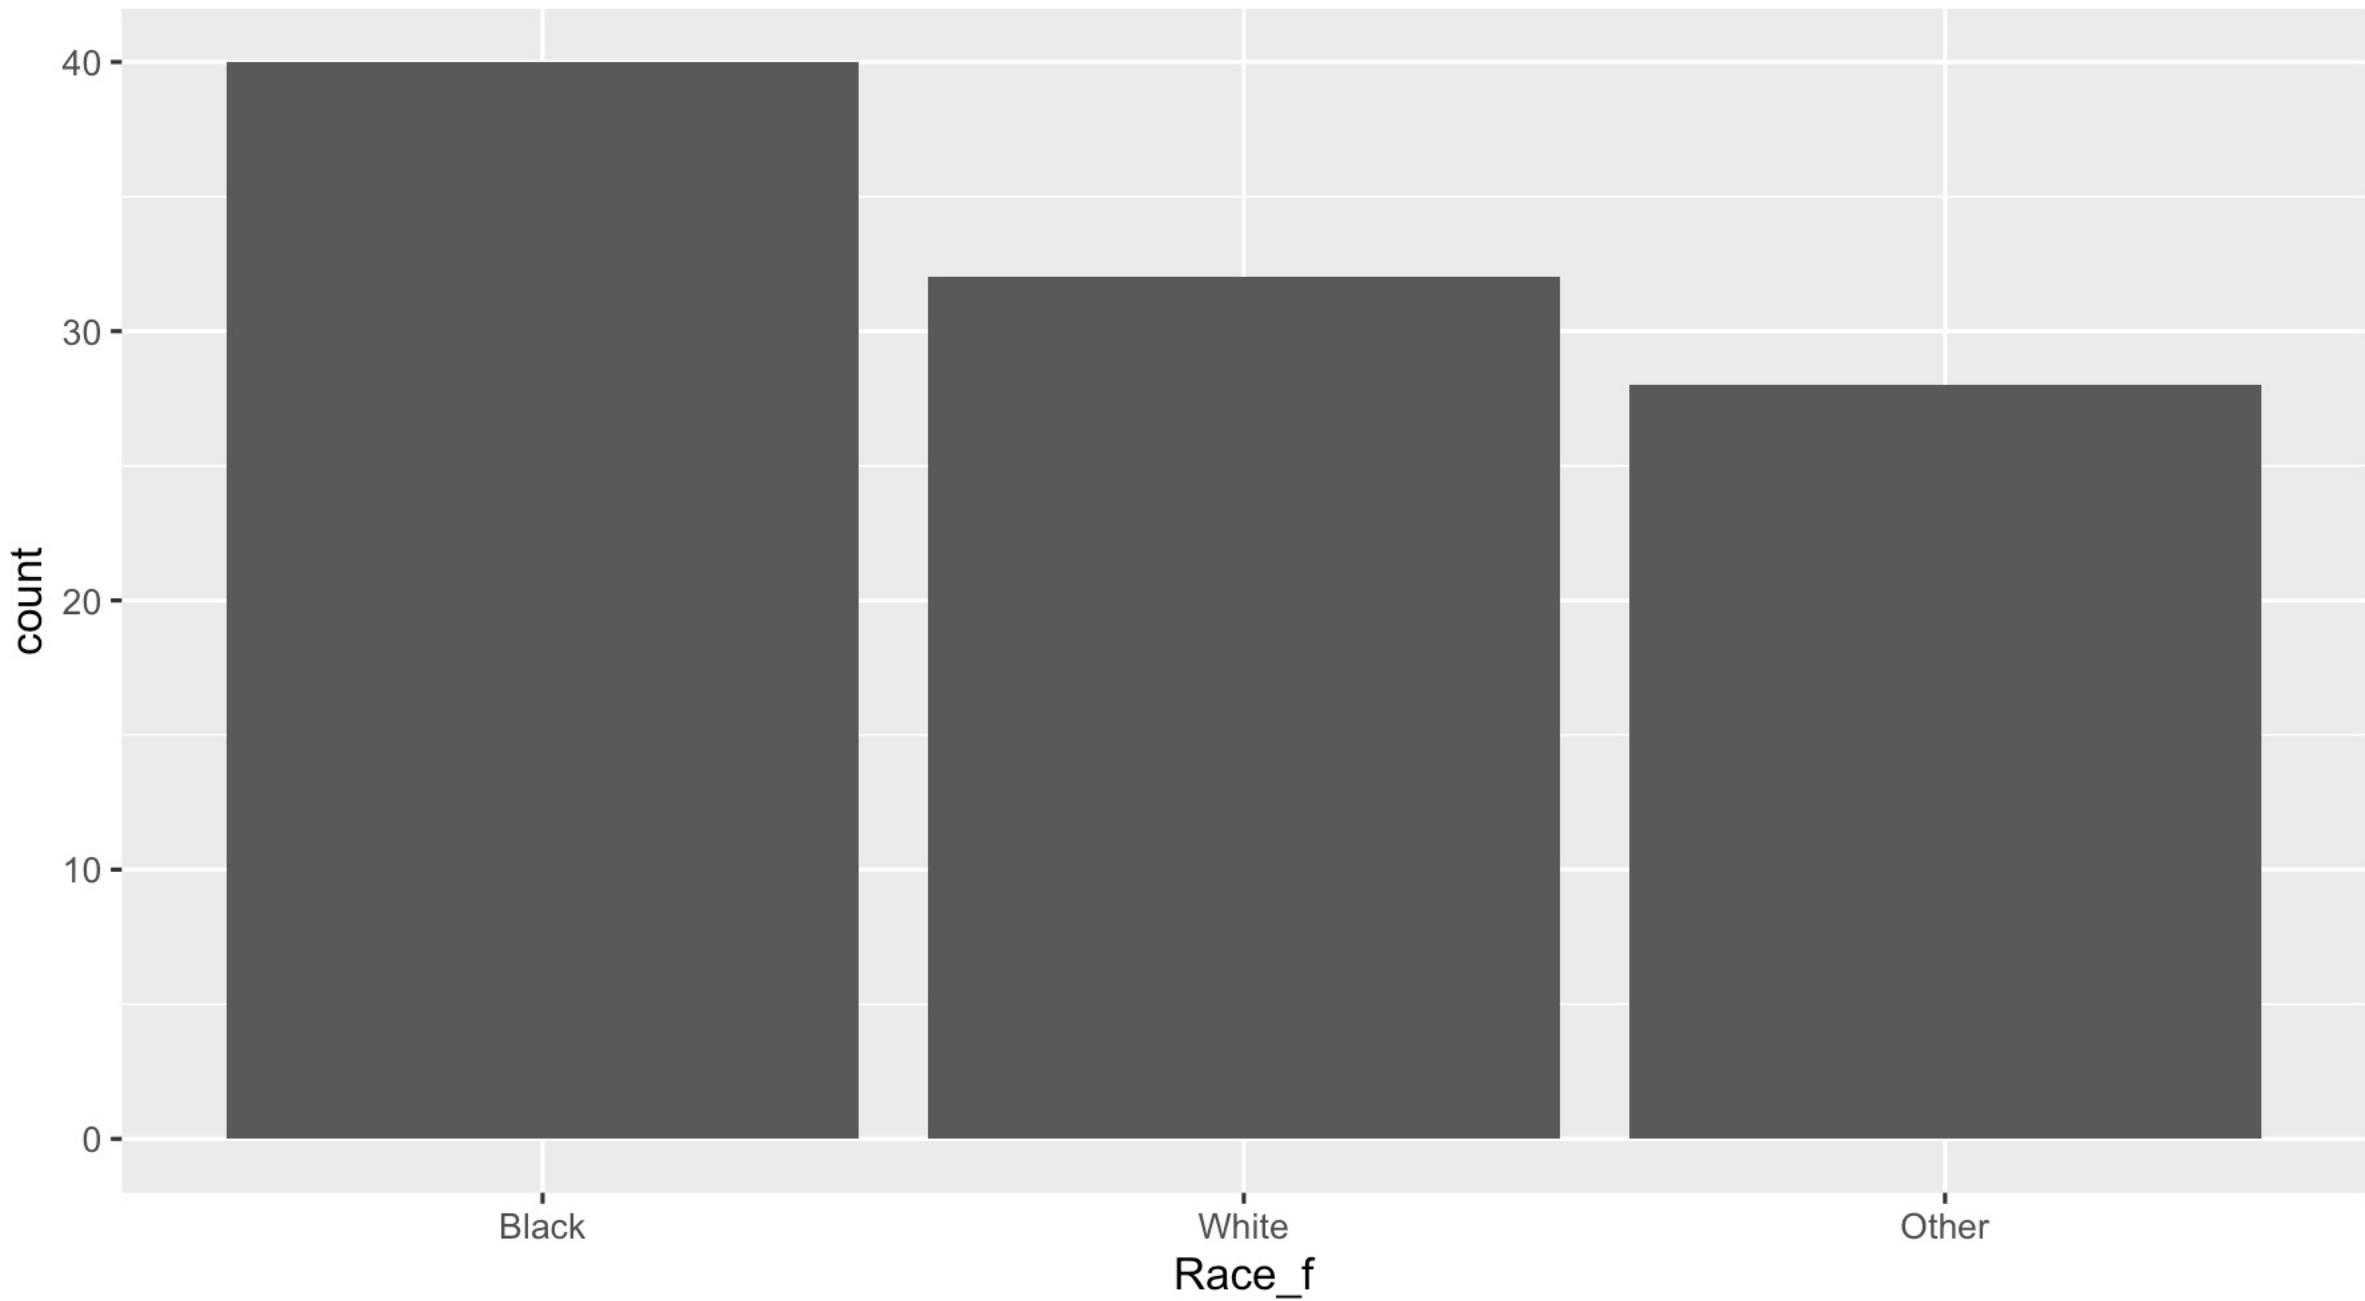

Order by value (usingforcats)

```
demo <- data %>%
  mutate(Race_f = Race %>%
          as_factor() %>%
          fct_infreq()))

ggplot(data,
       aes(Race %>%
             as_factor() %>%
             fct_infreq()) ) +
  geom_bar()
```

forcats package: helpful functions

- `as_factor(char_var)`:
convert a character variable to a factor
- `fct_infreq(factor)`:
take factor levels and set the order according to
(inverse) category frequency
- `fct_reorder(factor, num_var)`:
sort factor levels by a second, numerical variable
(like a pre-calculated count or average)

<https://www.rstudio.com/resources/cheatsheets/#forcats>

Note about `read.csv` (base R)

- Converts string variables to factors by default
- Can either:
 - Include `stringsAsFactors=FALSE`
 - Use `read_csv()` instead

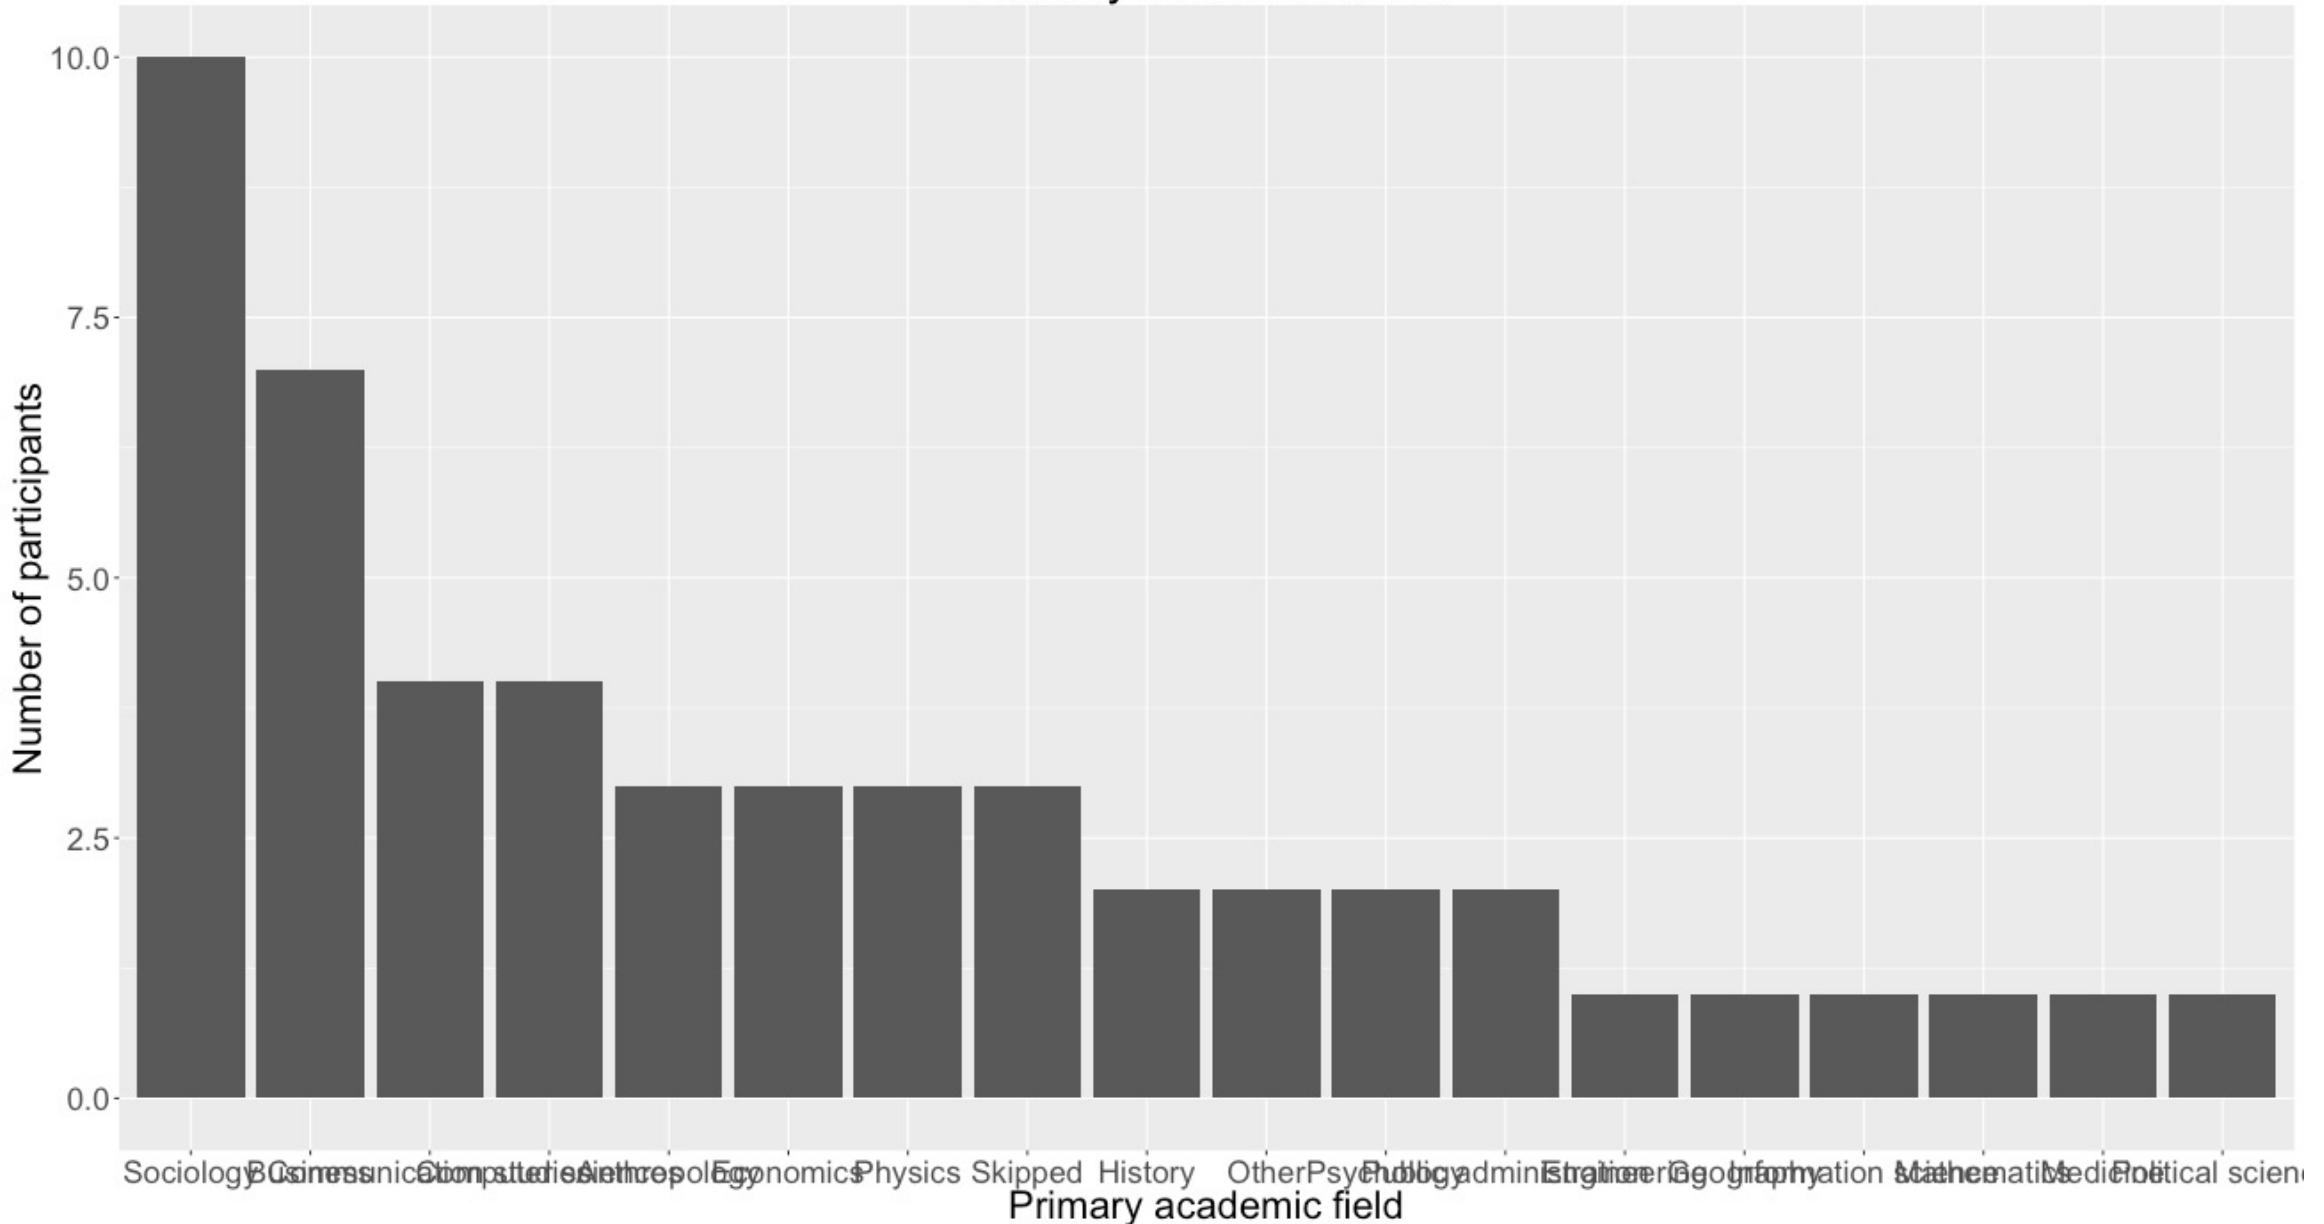

Factoring resources

From Amelia McNamara:

- RStudioConf 2019 slides:
[Working with Categorical Data in R Without Losing Your Mind](#)
- [Wrangling Categorical Data in R article](#)
- [Wrangling Categorical Data in R repository](#)

Problems with text variables:
Long category names

Primary academic field

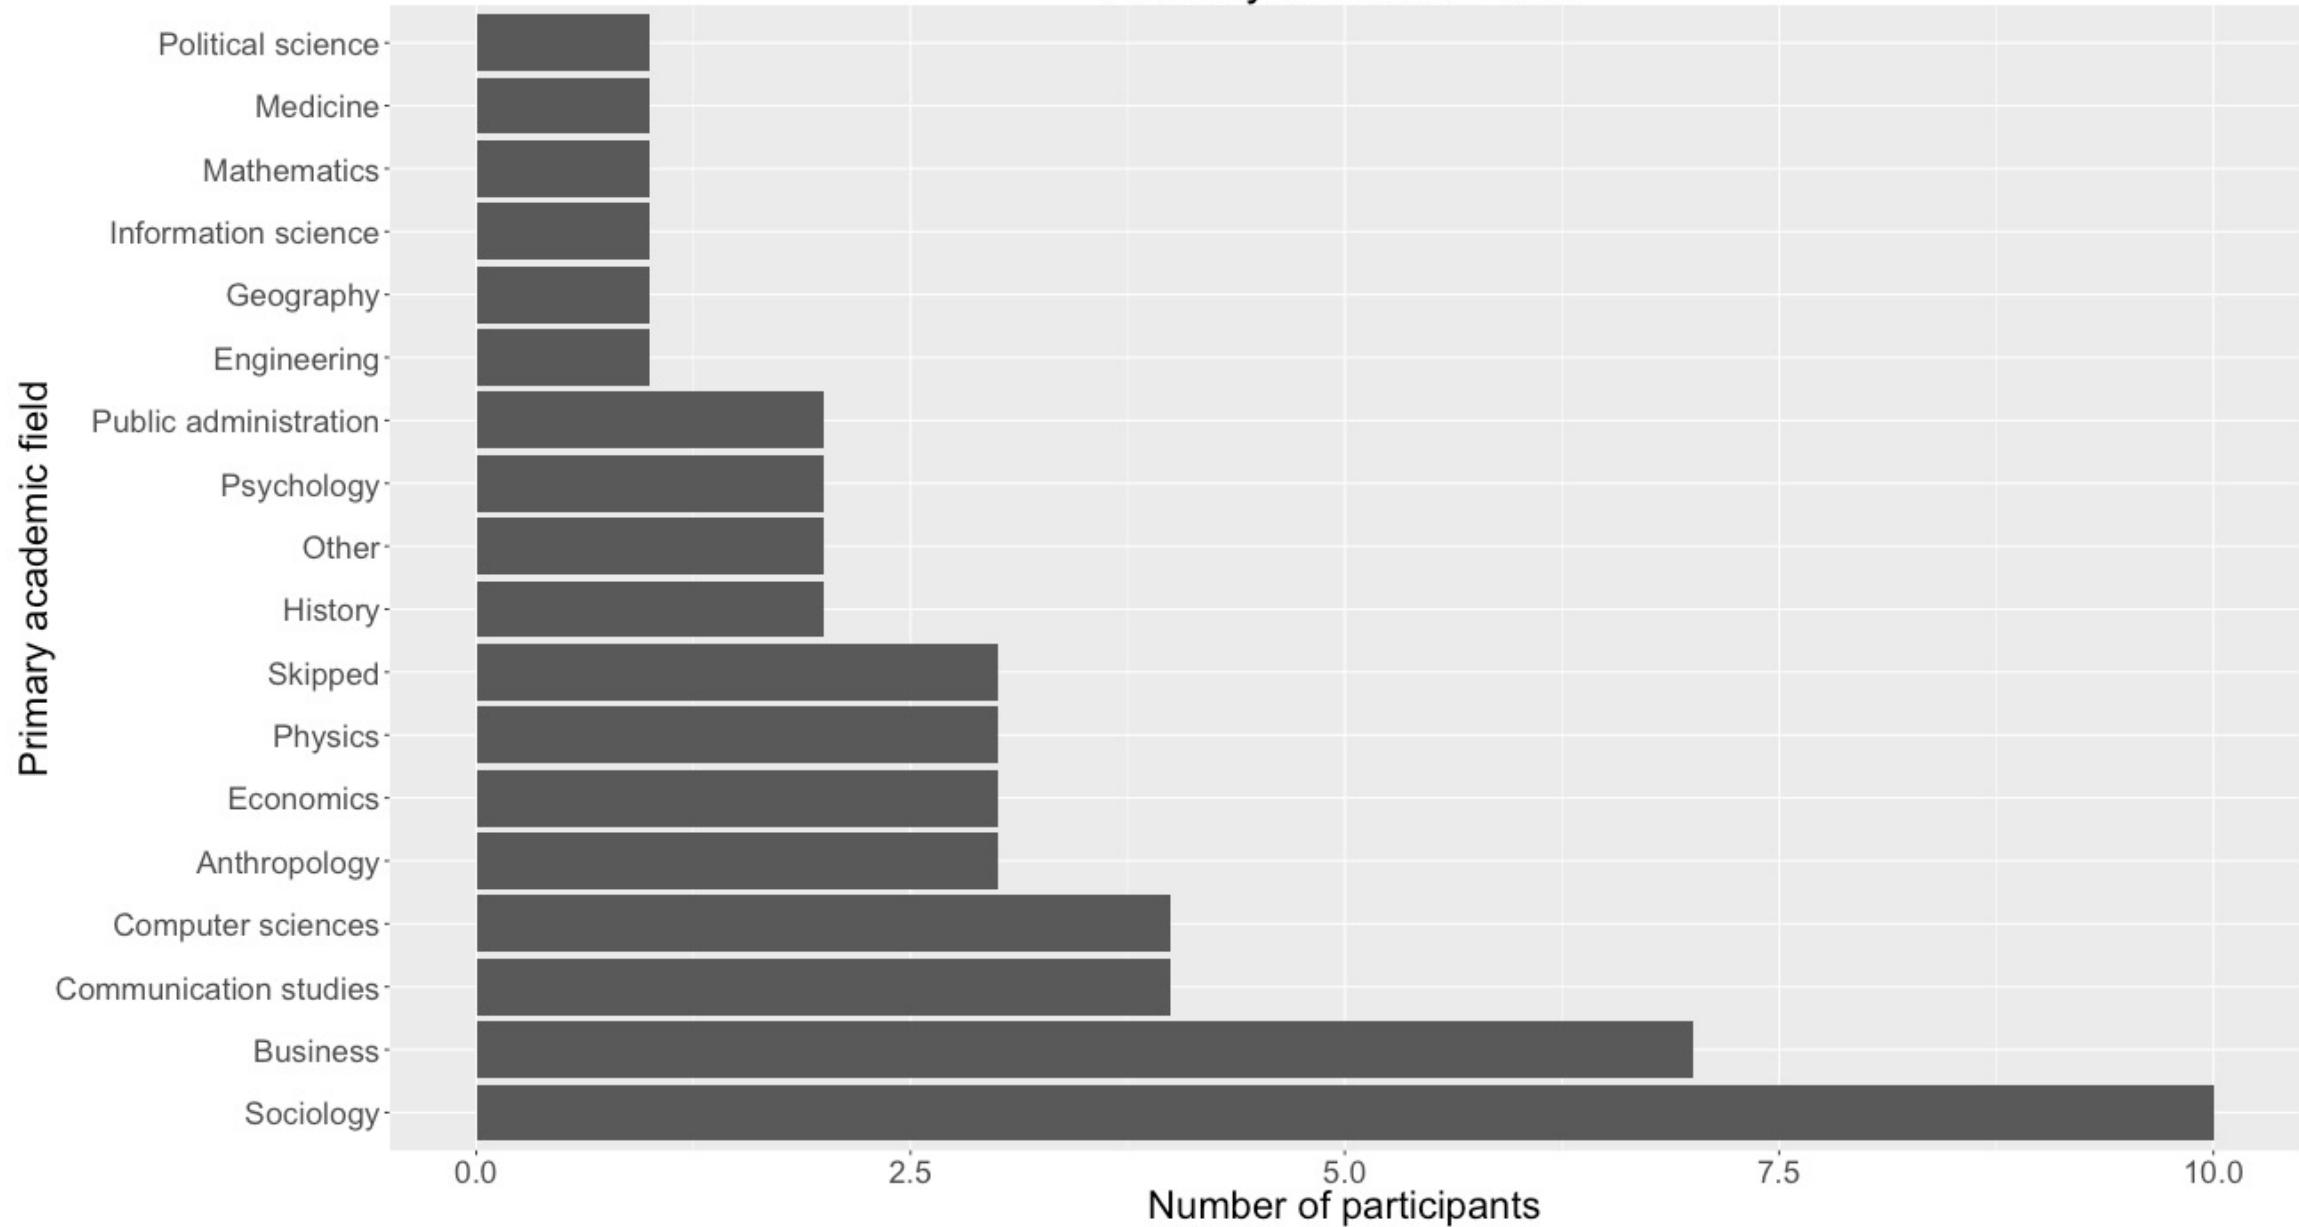

In ggplot2, have to flip the axes

```
+ coord_flip()
```

or

```
ggplot(df, aes(y=cat_variable)) +  
  geom_bar()
```

Primary academic field

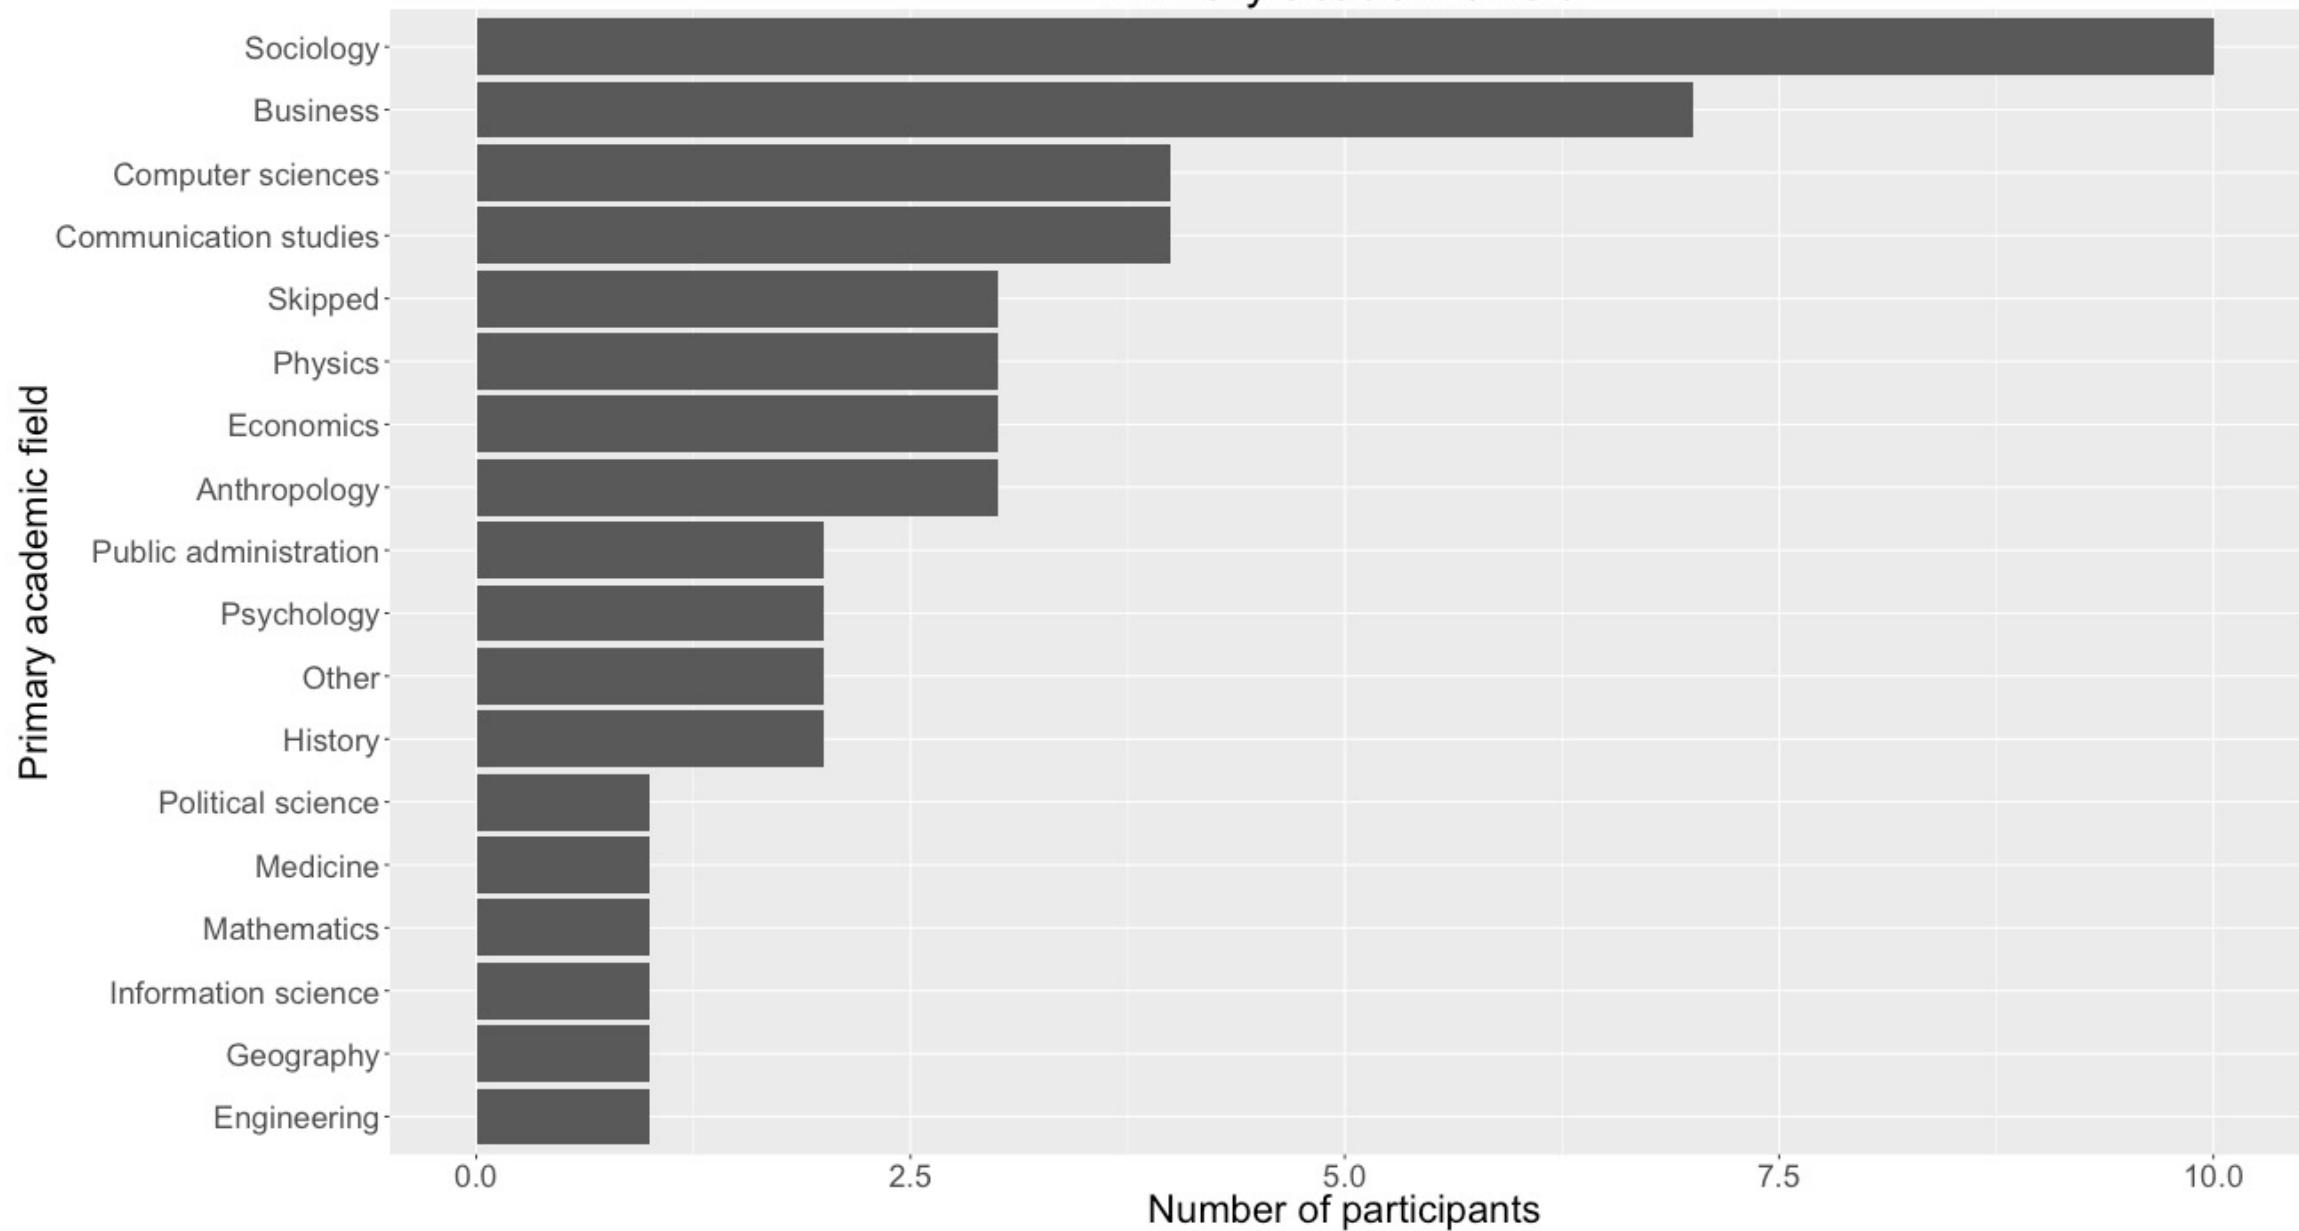

When you flip axes, you sort the other way

```
academic_field %>%  
  as_factor() %>%  
  fct_infreq() %>%  
  fct_rev()
```

Have to reverse the
order of the levels

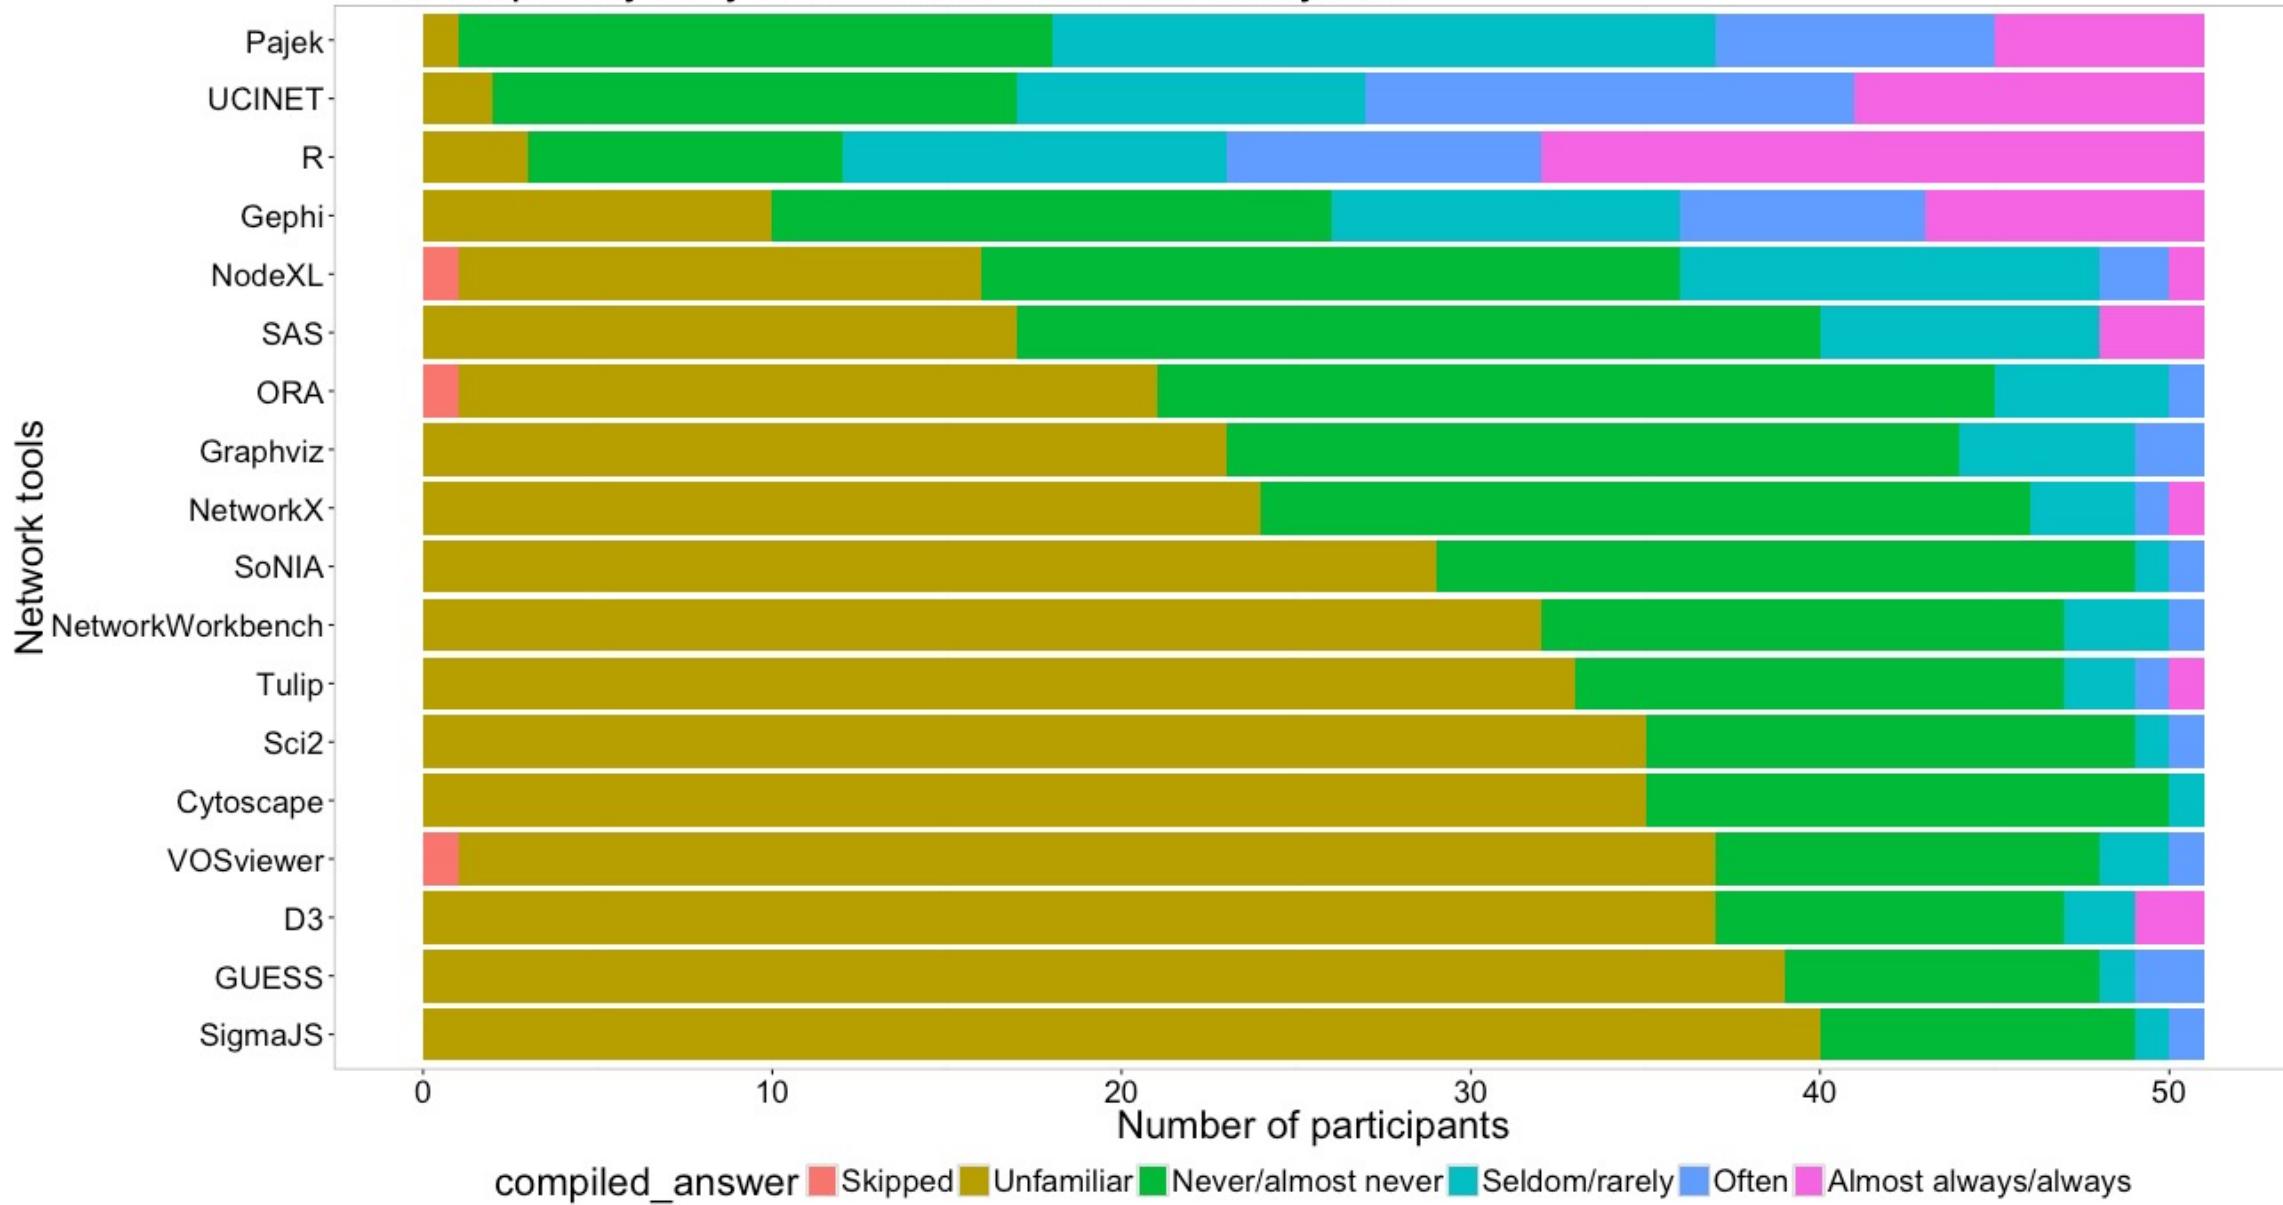

Primary academic field

Problems with text variables:
Arbitrary colors

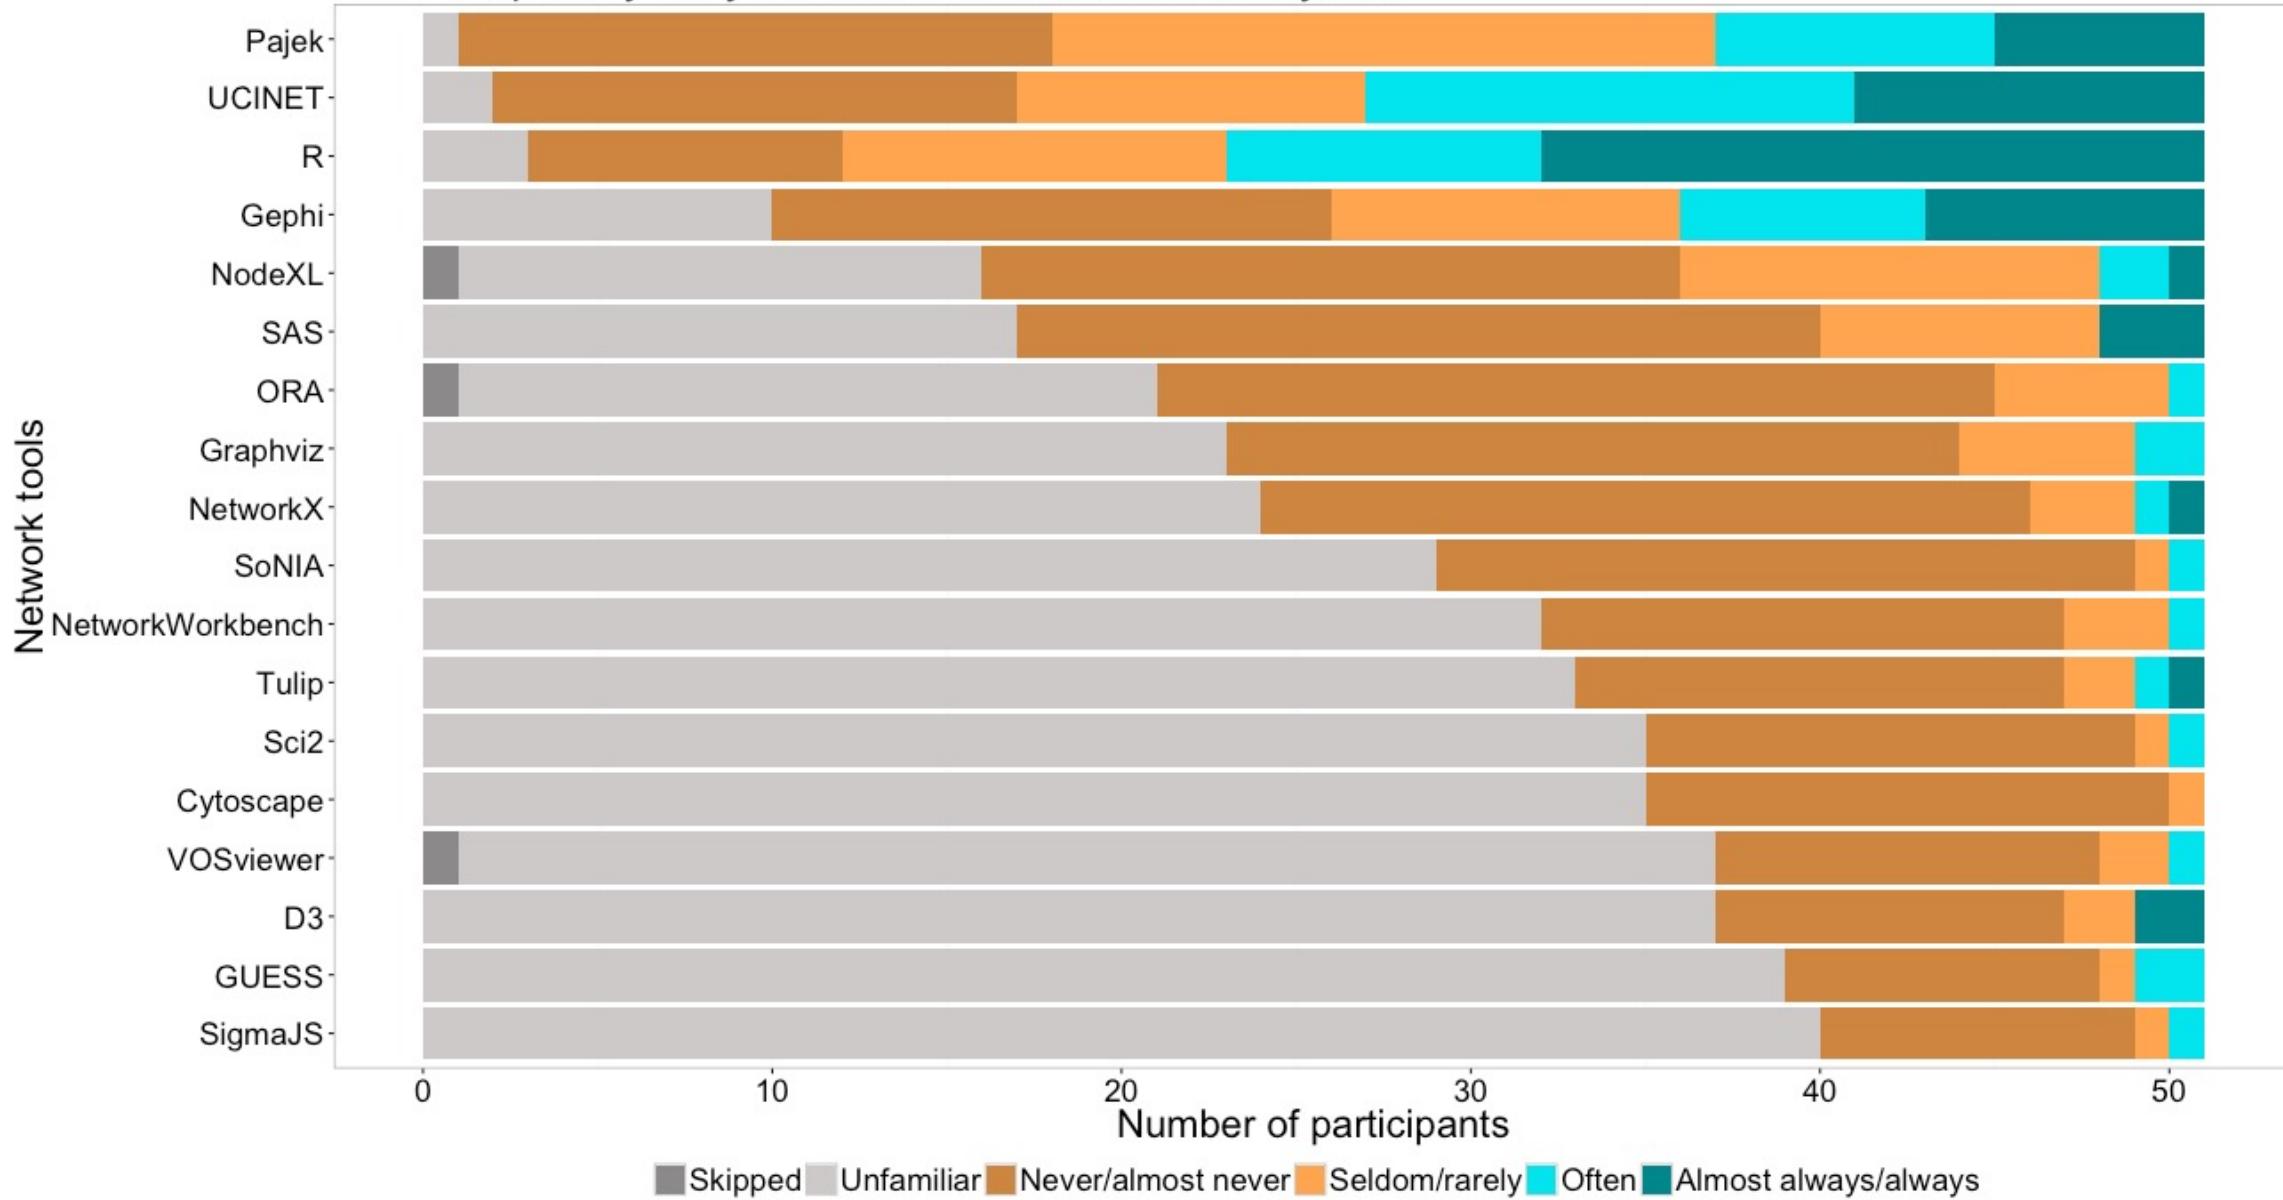

How frequently do you use these tools for analysis?

Select colors manually, or use alternate palette

```
scale_fill_manual(  
  values=c("snow4", "snow3",  
          "tan3", "tan1",  
          "turquoise2", "turquoise4"))  
  
# Also see package RColorBrewer  
scale_fill_brewer(palette="BrBG")
```

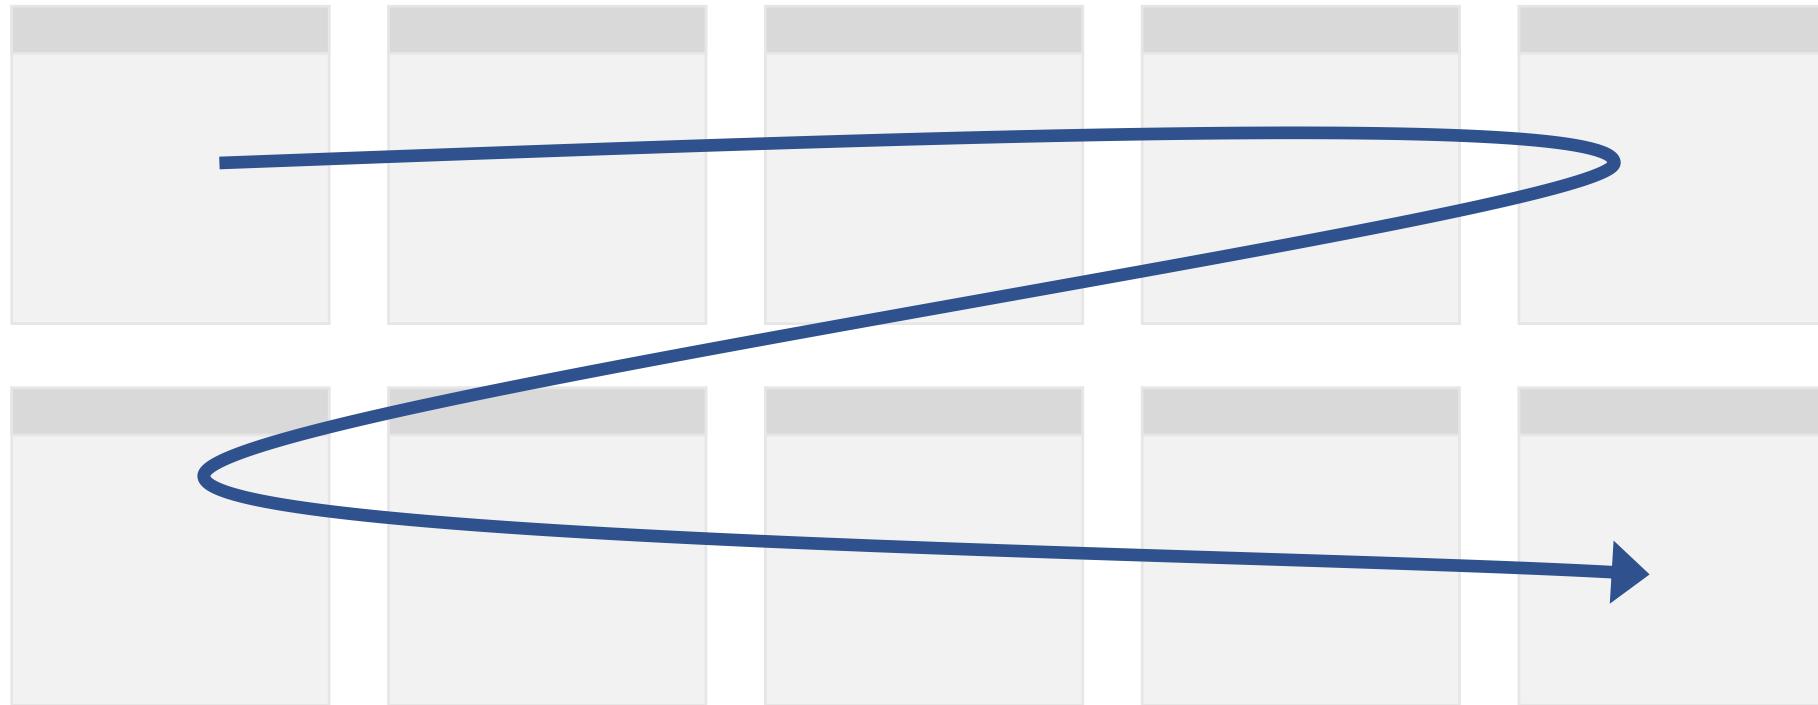

How frequently do you use these tools for analysis?

Creating repeated charts

facet_wrap()

```
+ facet_wrap(vars(variable))
```

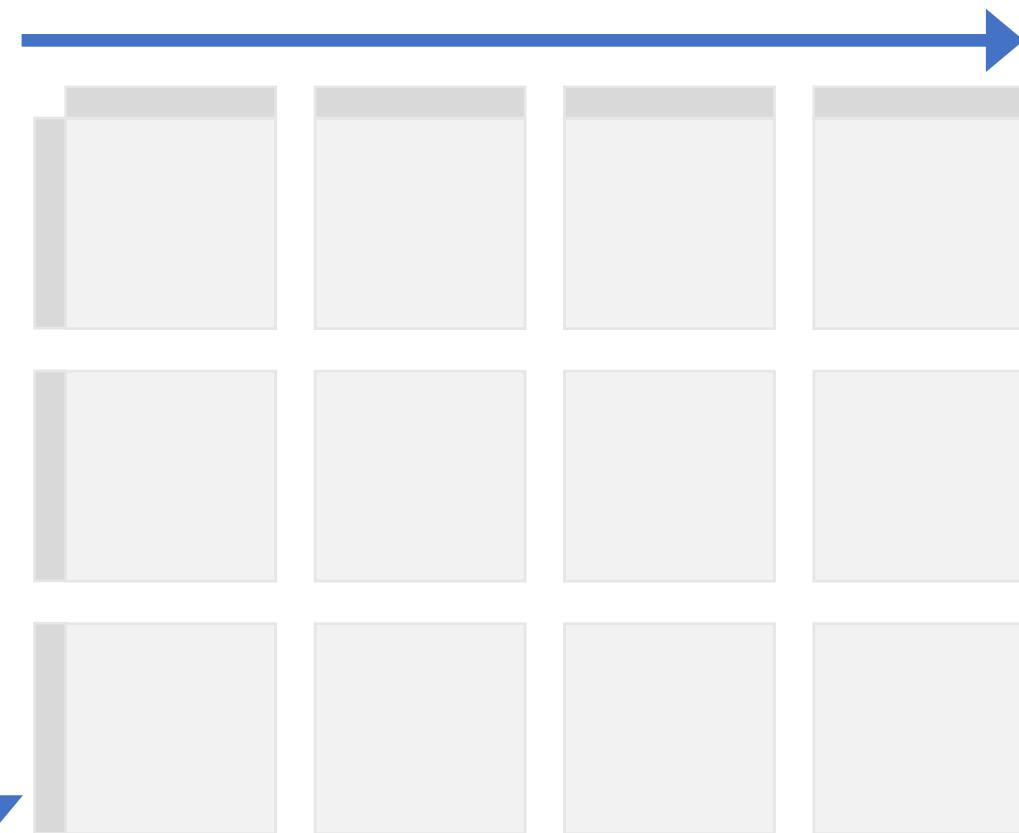

facet_grid()

```
+ facet_grid(rows=vars(yvar,  
cols=vars(xvar))
```

Another categorical variable

One categorical variable

Exercise 3: Inclusiveness Index

<https://belonging.berkeley.edu/inclusivenessindex>

Helpful data manipulation

filter

Select a subset of rows

```
data %>% dplyr::filter(name == "John")
```

same as

```
dplyr::filter(data, name == "John")
```

<https://www.rstudio.com/resources/cheatsheets/#dplyr>

select

Select a subset of columns (many options!)

```
data %>% dplyr::select(id, name, age)
```

```
data %>% dplyr::select(-count)
```

<https://www.rstudio.com/resources/cheatsheets/#dplyr>

Exercise 4: Customizing charts

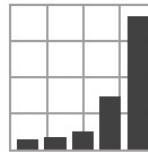

Scales

- Scales control how an aesthetics mapping displays in the chart, e.g.:
 - the labels that show up on the axis
 - the number of example sizes in a size legend
 - the colors used for a “fill” or “color” mapping
- Modify these properties by adding a scale layer to the chart

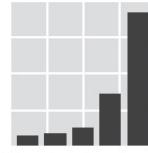

```
scale_x_continuous()  
scale_y_log10()  
scale_fill_discrete()
```

Themes

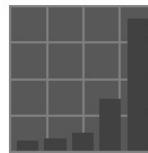

- Themes control properties of various visual elements, including:
 - Axis titles, text, ticks, lines
 - Plot colors, margins, text
 - Legend colors, margins, text
- Can add built-in themes as new layers, override specific theme elements, or build your own custom theme

r + theme_bw()
White background with grid lines.

r + theme_gray()
Grey background (default theme).

r + theme_dark()
Dark for contrast.

r + theme_classic()
r + theme_light()
r + theme_linedraw()
r + theme_minimal()
Minimal theme.
r + theme_void()
Empty theme.

<https://github.com/rstudio/cheatsheets/blob/master/data-visualization-2.1.pdf>

geom vs. scale vs. theme

Adding something that will appear
inside the **chart coordinate space**?

You will (almost always) be adding a **geom**!

Changing the way a **variable is displayed**?
(e.g., different axis breaks, different color mapping)

You will be adding a **scale**!

Changing the **look and feel** of the chart?

You will be adding or making changes to a **theme**!

Advanced ggplot2 workshop

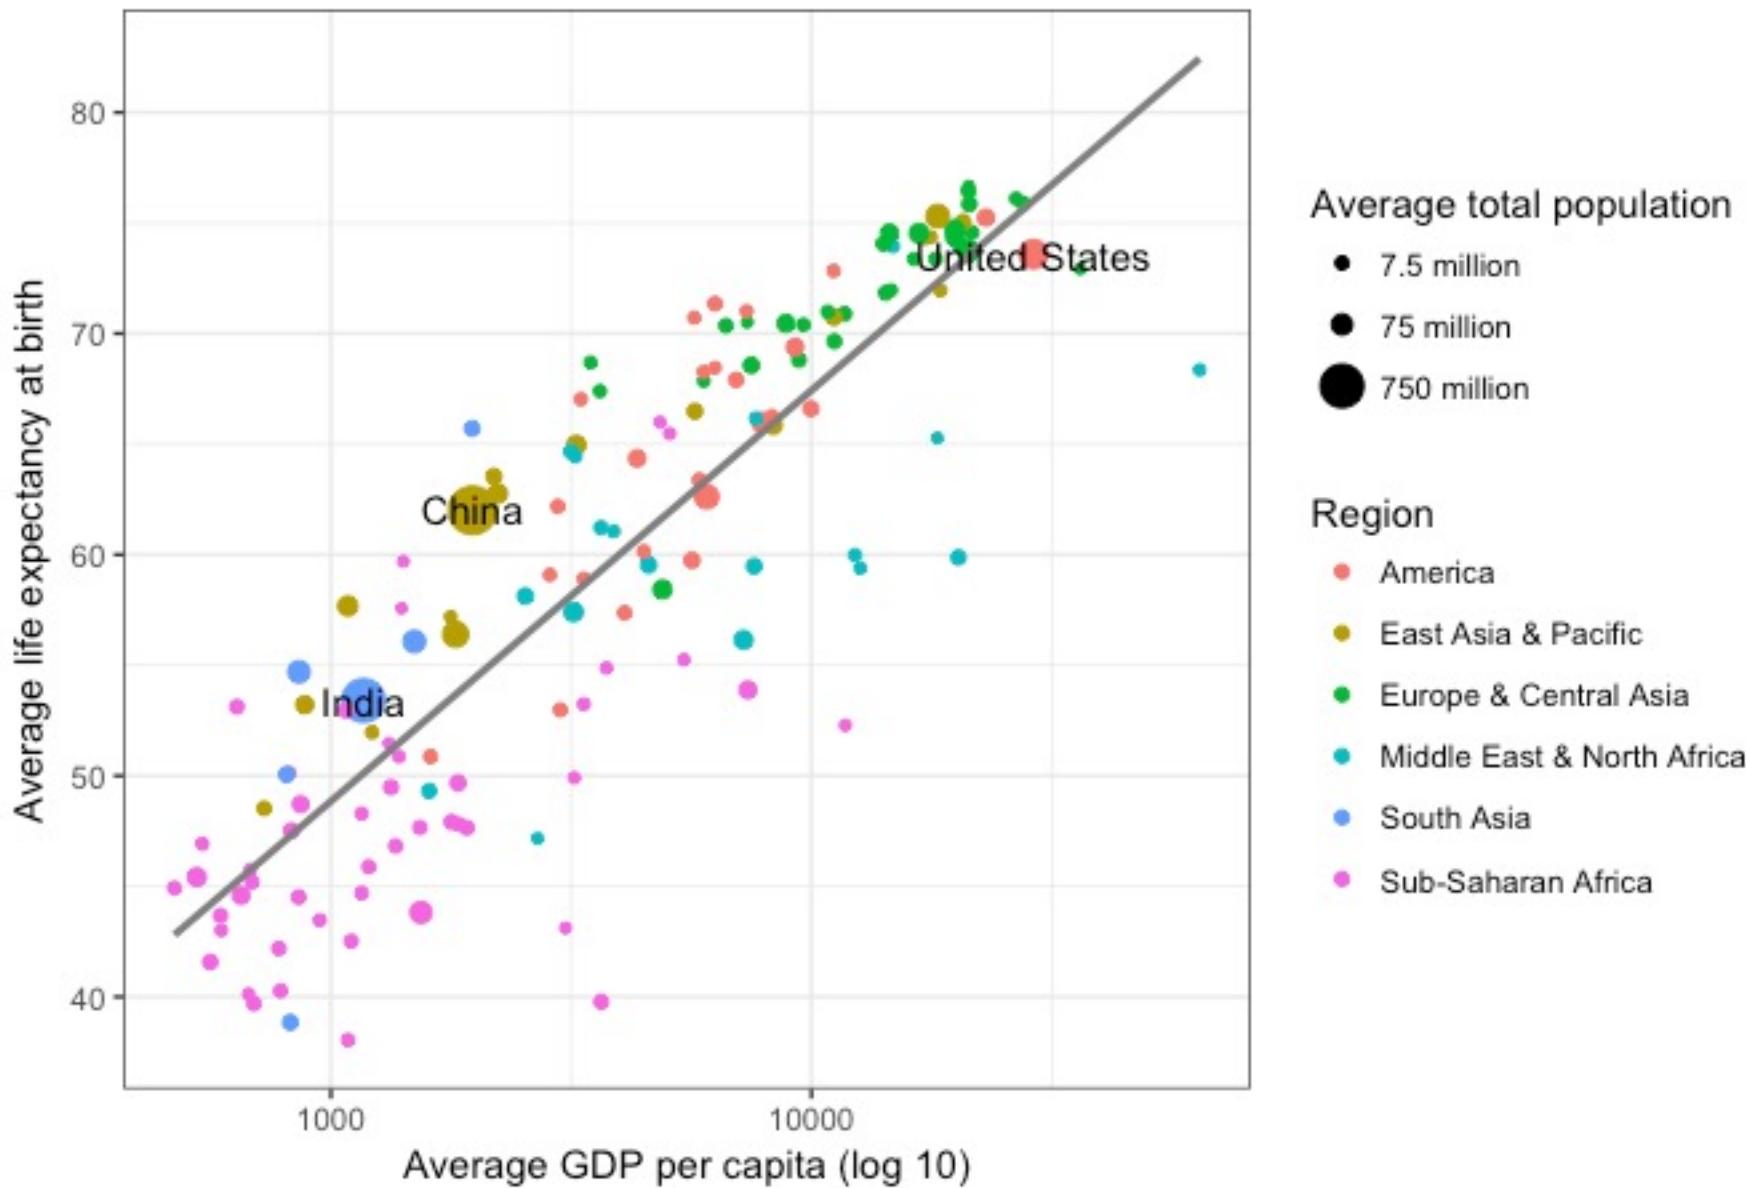

[Workshop video](#)

[Workshop materials](#)

Exercise 5: Gapminder Data

<http://www.gapminder.org/>

Averages across all years of the traditional Gapminder dataset

Accessibility

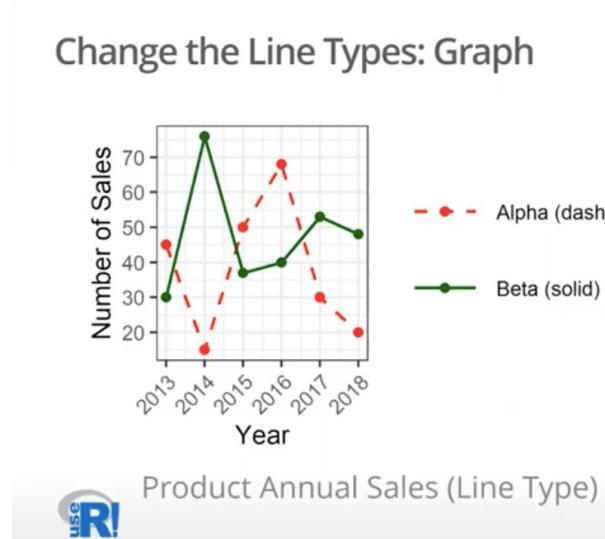

Low Vision

- Large text
 - “[output-examples](#)” file
- High color contrast
 - Both marks/text on background and labels on marks
 - Check with [savonliquide package](#)

Color Vision Deficiency

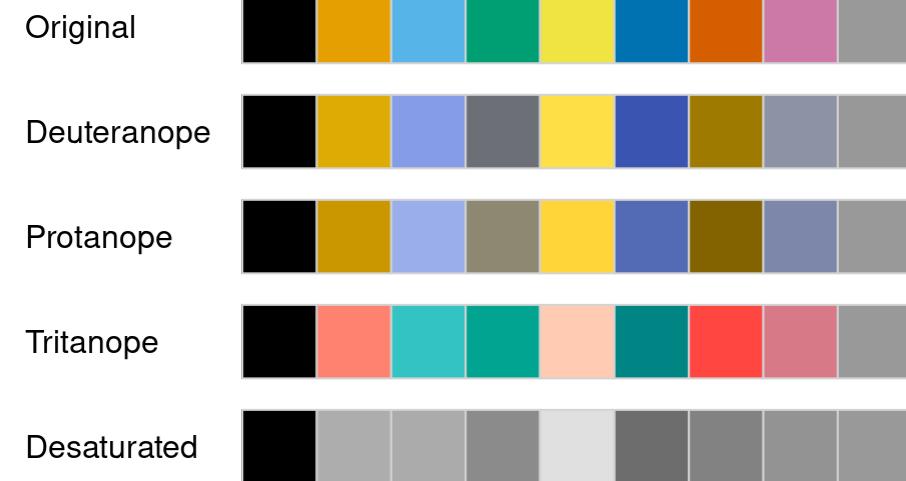

Dual encoding (never just color)

- Line color – also vary line type
- Point color – also vary point shape

Color palettes

- [colorspace package](#)

https://www.youtube.com/watch?v=mbi_JVC1arM

<http://colorspace.r-forge.r-project.org/index.html>

Alternative Text for Screen Readers

In R, RMarkdown

- `fig.alt` in code chunk (new, just for HTML output)
- `fig.cap` in code chunk as backup
- embedded images:
![alt text or image title](path/to/image)
- New: ggplot2 v3.3.4 adds [alt option in `labs\(\)`](#), with plans to propagate to Rmd, Shiny

Writing good alt text for visualizations

alt= “**Chart type** of **type of data**
where **reason for including chart**”

Include a **link to data source**
somewhere in the text

<https://nightingaledvs.com/writing-alt-text-for-data-visualization/>

Longer descriptions:
[savonliquide package](#)

Converting graphics to sound, touch, text

- sonify package
- tactileR package
- [BrailleR package](#)
 - Note: set plot title, subtitle, caption using labs()

Accessibility Resources

- [savonliquide package](#)
- [Making betteR figures: Accessibility and Universal Design](#)
- [Highlights from the DVS accessibility fireside chat](#)

Advanced topics:
Mapping, saving charts out

Mapping resources

- [tigris](#) for downloading TIGER/Line shapefiles
- [sf \(simple features\)](#) for spatial tables
 - [Spatial Data Science book](#)
 - [Spatial Data Science in the tidyverse slides](#)
 - [Spatial Data Science in the tidyverse video](#)

Other helper packages

- [`gganonymize`](#) to randomize text in `ggplot2` figures
- [`visdat`](#) to visualize variable classes and missing data
- [`ggthemes`](#) for additional themes and scales, especially ones that match software defaults (e.g., Tableau)
- [`esquisse`](#) for building `ggplot2` charts interactively
- [`colorblindr`](#) for simulating color vision deficiency
- [`ggpubr`](#) for publication-ready plots

ggplot2 Resources

- General ggplot2 information
<http://ggplot2.tidyverse.org/>
- R Graphics Cookbook (recipes for plots)
<http://www.cookbook-r.com/Graphs/index.html>
- R for Data Science (online book that includes ggplot2)
<http://r4ds.had.co.nz/>
- ggplot2: Elegant Graphs for Data Analysis (book by Hadley Wickham)
<http://ggplot2.org/book/>
- ggplot2 cheatsheet (also in RStudio)
<http://bit.ly/ggplot2-cheatsheet>
- [Data Carpentry lesson on ggplot2](#)
- [Data Visualization: A Practical Introduction, by Kieran Healy](#)
- [RStudio “Visualize Data” Primer](#)

Thanks for your feedback!

ggplot2: Chart quirks

See [“templates” file](#)

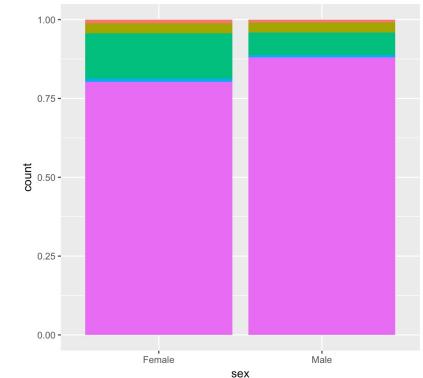

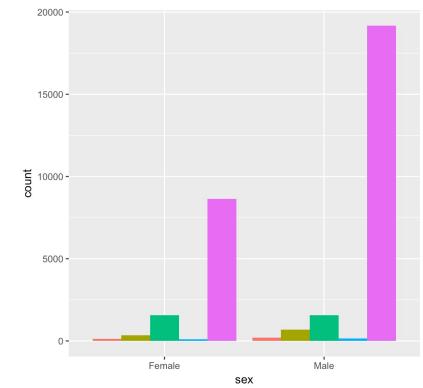

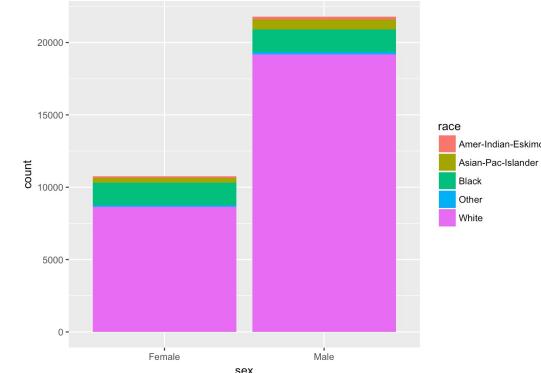

Chart components/slots

Bar chart, for example:

- x
category (the names of the bars)
- y (optional)
*default is count, but can also specify a number
(the length of the bars)*
- color (optional)
category (grouped or stacked bars)

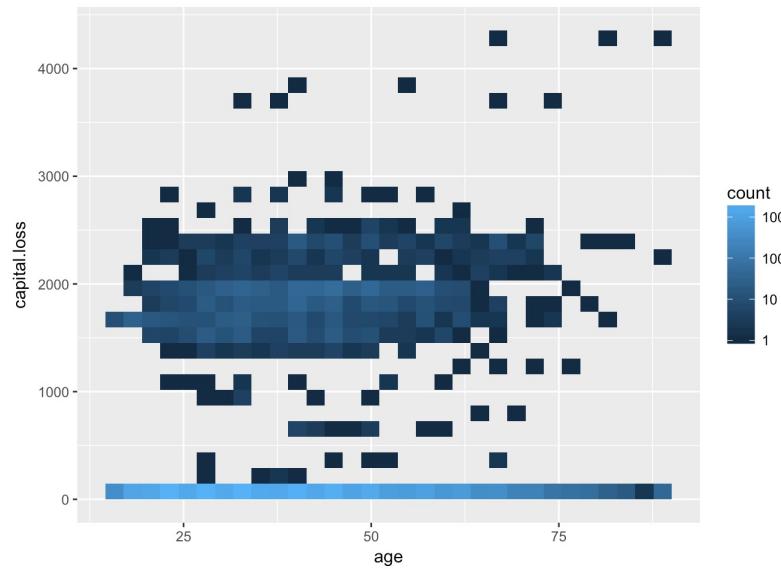

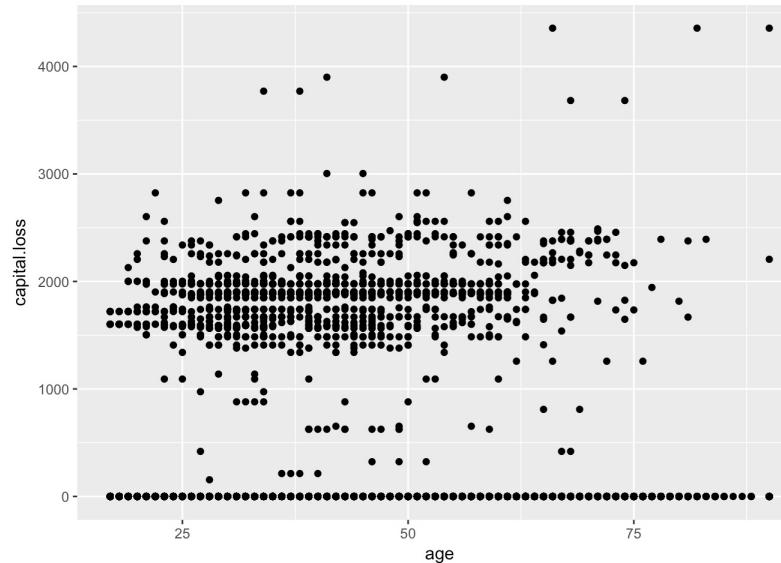

Bar chart

- geom_bar() vs. geom_col()
- count vs. identity vs. summary
- categorical vs. continuous
- stack vs. dodge vs. fill
- bar vs. pie

Scatter plot

- Overplotting
- point vs. bin2d

Line chart

- identity vs. summary
- line vs. smooth
